R EVOX RIFA

Electrolytic Capacitors

QUALITY POLICY

At Evox Rifa we are totally committed to continuously improving our performance, with the goals of providing our customers with world class products and services, and meeting our owners' expectations concerning profitability and growth.

To reach these goals we are continuously working to

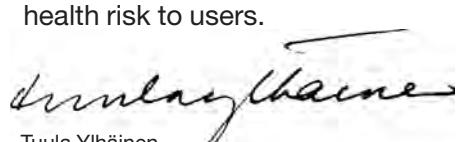

- improve quality planning and efficiency in all processes
- focus on customer needs
- optimise costs
- emphasise personnel competence and training.

In all activities we carefully respect and comply with the requirements of society and environment.

ENVIRONMENTAL POLICY

Evox Rifa is committed to:

- adhering to high standards in environmental quality
- providing a workplace that protects the health and safety of our employees and the communities close to our facilities
- supplying products that cause minimal environmental load and minimal health risk to users.

COMPANY PRESENTATION

The combining of the Rifa and BHC ranges of electrolytic capacitors into one catalogue, gives design engineers one of the widest choices of capacitors to suit every application in power electronics equipment.

The Company's technology, developed in close co-operation with some of the leading power electronics equipment designers, ensures that our products meet the most demanding performance requirements. This technology is supported by unique modelling software that can accurately predict the capacitor performance under given operating conditions.

Our Research and Development teams are constantly evaluating the latest materials and developing electrolytes to keep our technology amongst the most widely respected in the world of power electronics. We are committed to not only satisfying customers' current needs, but to improving and developing products in anticipation of their future requirements.

Each stage of the process, from design through production to despatch, is supported by a comprehensive quality system to provide the long reliable service life that is required in applications such as; inverters for motor drives and wind turbines, automotive power electronics, uninterruptible power supplies.

With Electrolytic Capacitor production in Europe and in Asia, the Evox Rifa Group offers global customers a comprehensive range of products and logistic solutions

PRODUCT MARKING FOR TRACEABILITY

Evox Rifa Electrolytic Capacitors are marked with year and month / week of manufacturing and batch code.

Example:

ALS, ALC	165392/1 0631	= Batch 165392/1, Year 2006, Week 31
PEG124, PEG126, PEG220, PEG225, PEG 226,		
PEH126:	0615/01	= Year 2006, Week 15, Batch No 1.
PEH169, PEH200:	0603/85966	= Year 2006, March, Batch No 85966.
PEH506, PEH526, PEH532, PEH534, PEH536:	0605004	= Year 2006, May, Batch No 4.

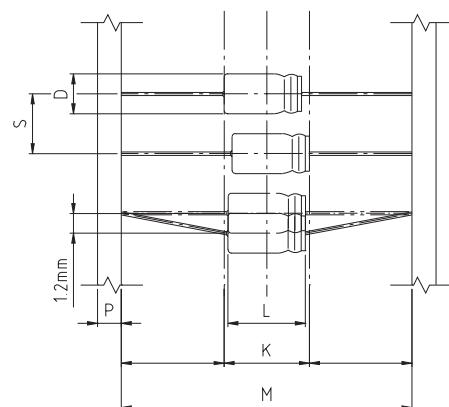

AXIAL TAPING SPECIFICATION

The taped capacitors are delivered in accordance with IEC 60286-1. The components are taped so that identical poles are turned to the same side of the tape. The cathode lead tape is blue.

PEG 124

Case code	D	L	K	S	M	P	Standard Content/reel
A	10	20	21.4	15 ± 0.75	73 ± 1.5	6 ± 1	500
B	10	29	30.4	15 ± 0.75	73 ± 1.5	6 ± 1	500
C	13	20	21.4	15 ± 0.75	73 ± 1.5	6 ± 1	400
D	13	29	30.4	15 ± 0.75	73 ± 1.5	6 ± 1	400
E	13	37	38.4	15 ± 0.75	73 ± 1.5	6 ± 1	400

Dimensions in mm.

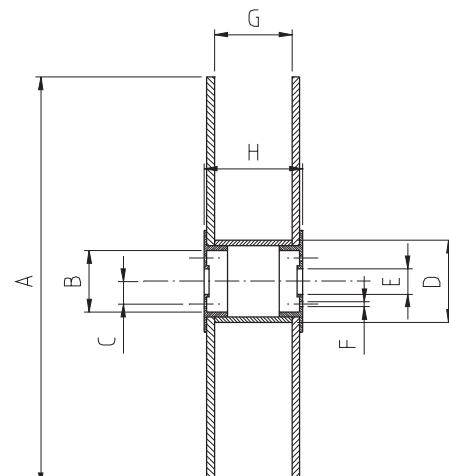

TAPING

E Reel hole diameter	30.2 ± 0.4
F Feeding hole diameter	8.0 ± 0.2
G Inside reel width	90 ± 1
H Reel width	98 ± 1

Dimensions in mm.

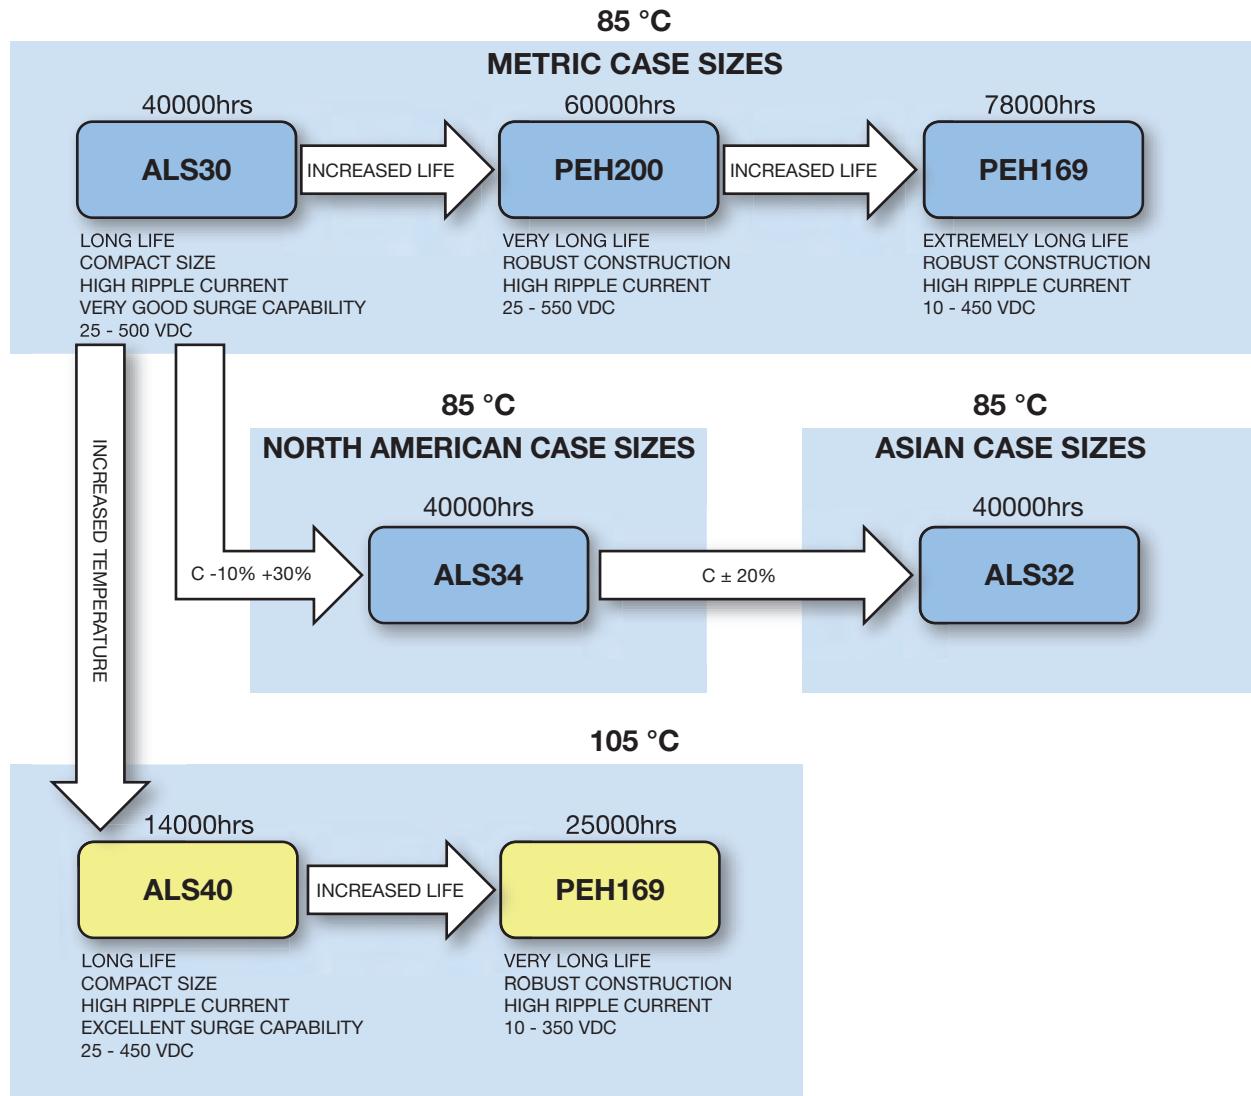

MARKING

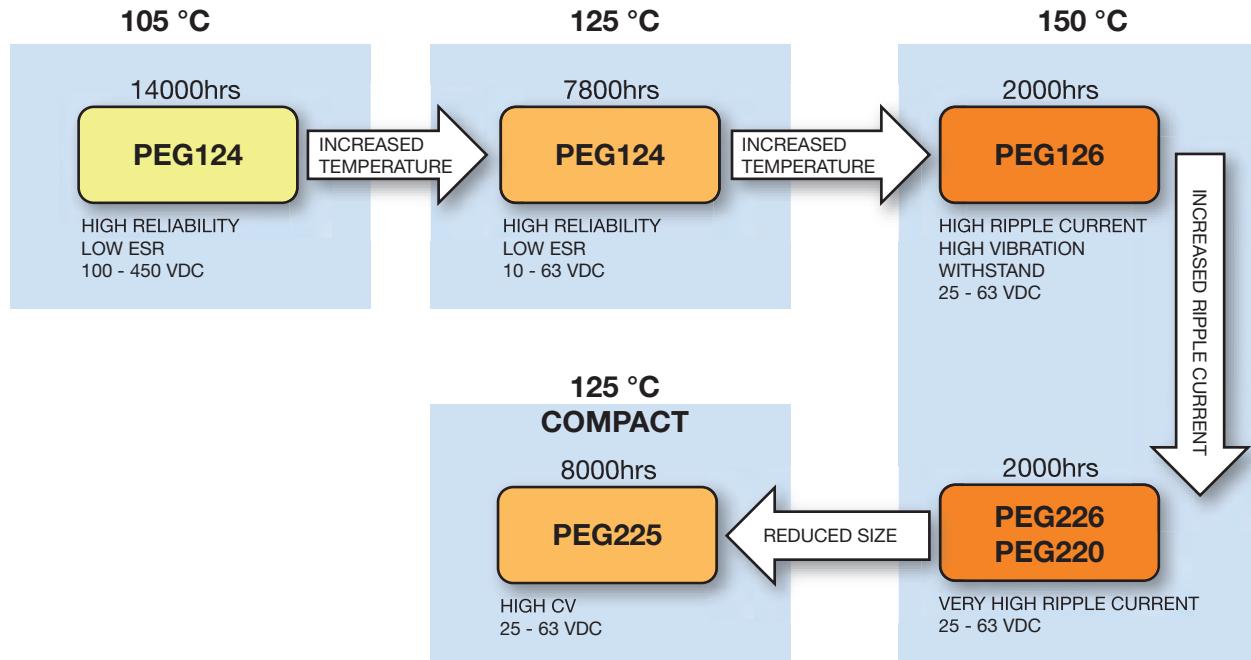

Standard marking for: PEG and PEH types

Standard	
Rated capacitance	Yes
Capacitance tolerance	Yes
Rated voltage	Yes
Date of manufacture	Yes, coded
Polarity indication	Yes
Article code	Yes

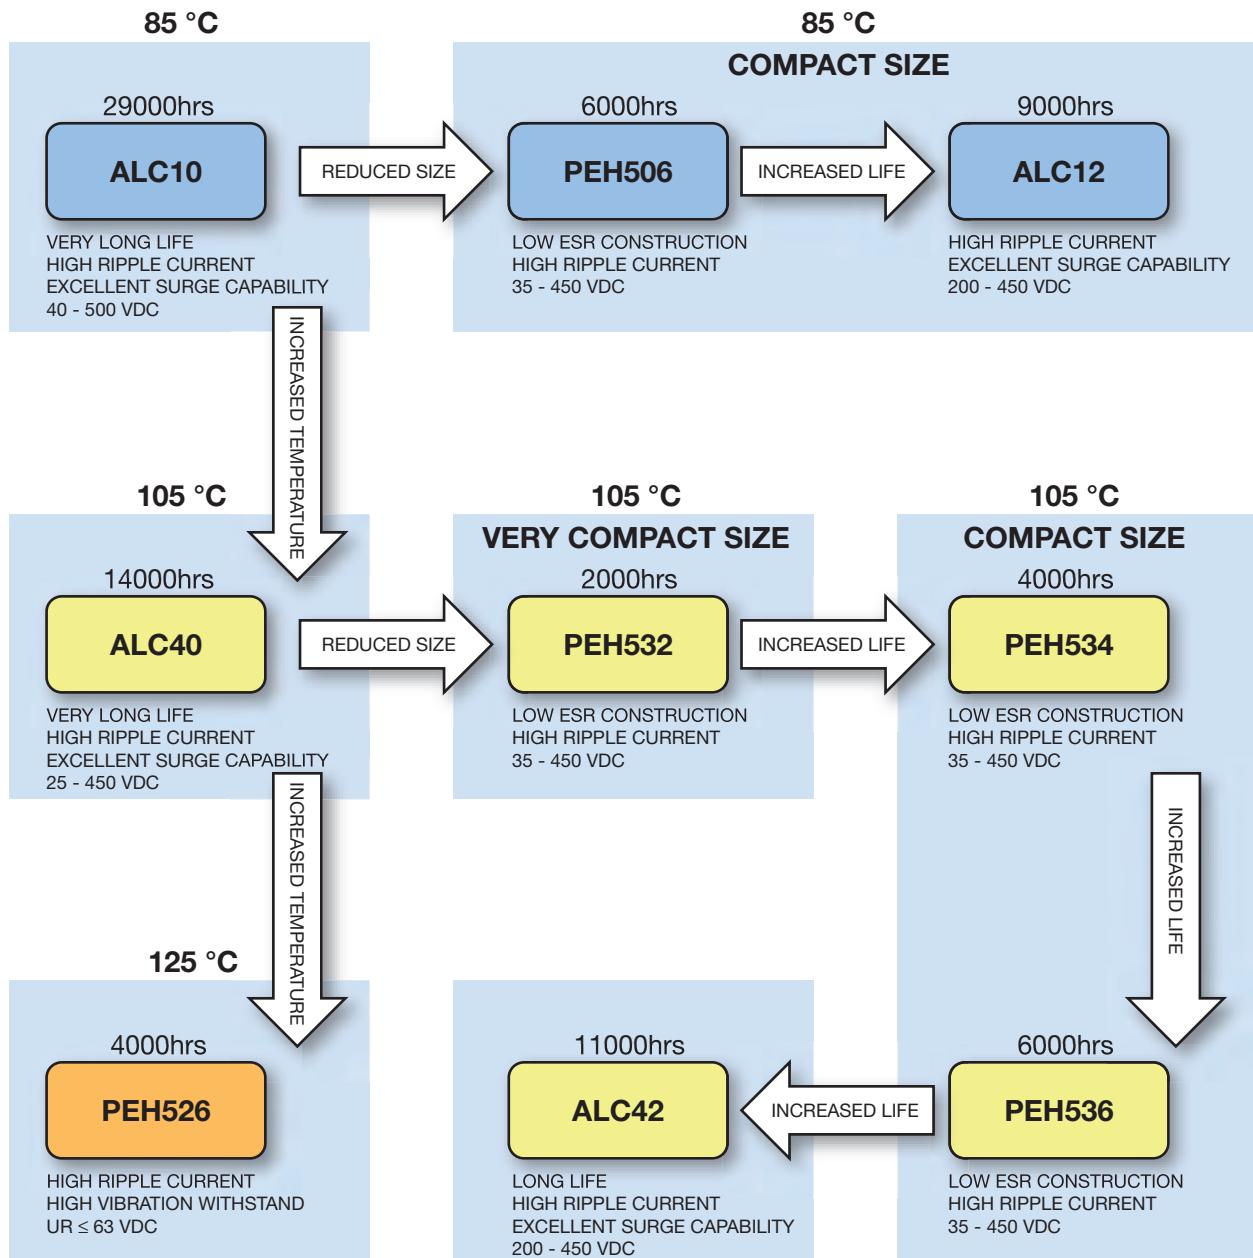

SCREW TERMINALS

AXIAL

SNAP-IN

Life expectancy figures based on operation at upper category temperature with rated d.c. voltage applied.

RIFA ELECTROLYTIC CAPACITORS

When ordering, we recommend that both the full RIFA code number and the specific characteristics of the component are quoted, in order to eliminate any possibility of interpretation error. Please see the example below.

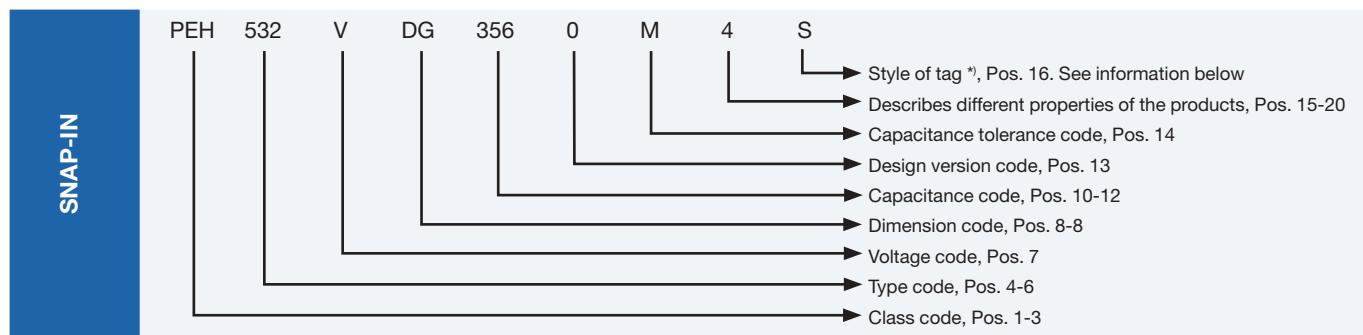

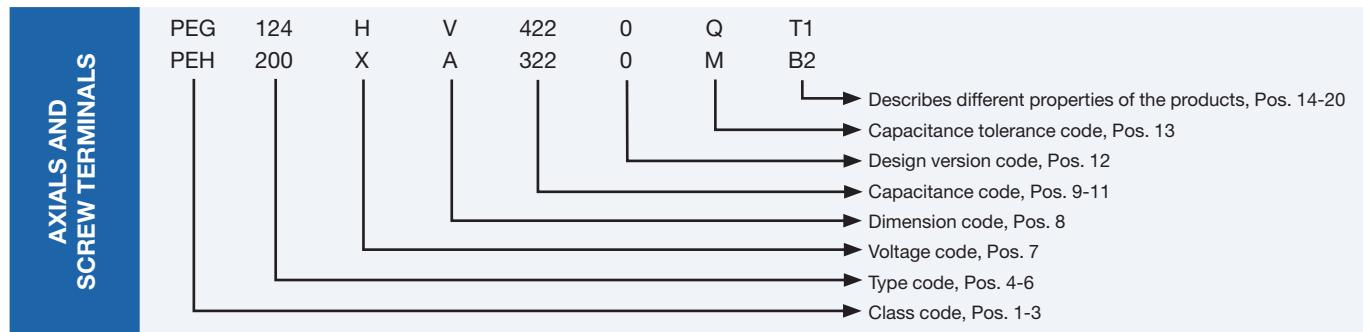

General ordering information

The RIFA article code consists of a maximum of 20 positions.

Pos 1–20

A	B	C	1	2	3	D	E	4	5	6	F	G	T	1					
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

The basic version of each article is designed with a fifteen character article code.

*) Style of tag

- Blank = Standard pin length 6.3 mm
- s = Short pin length 4 mm
- P = Short pin length 5 mm
- R = Stand-off pin
- D = 0 Special Tag (out of above design)

EXAMPLE

Class code:

"P" = RIFA
 "E" = Electrolytic capacitors
 "H" = Radial terminations
 "G" = Axial terminations

Type code:

Type code indicate performance and type of terminations.

Voltage code:

Rated voltage code, the code is specified in each article table.

Dimension code:

Dimension code, the code is specified in each article table.

Capacitance code:

Number of digits in capacitance value in μF .

The two significant digits in the capacitance value.

Example: 2100 is the code for 10 μF

6330 is the code for 330000 μF .

Design version code:

"0" for the basic version, "the catalogue product". For higher performance products, CAD-products letters, from A to Z is used.

Capacitance tolerance code:

Capacitance tolerance code.

Example: Q: -10 + 30% K: $\pm 10\%$

M: $\pm 20\%$ J: $\pm 5\%$

Y: $\pm 15\%$ T: -10 + 50%

BHC ELECTROLYTIC CAPACITORS

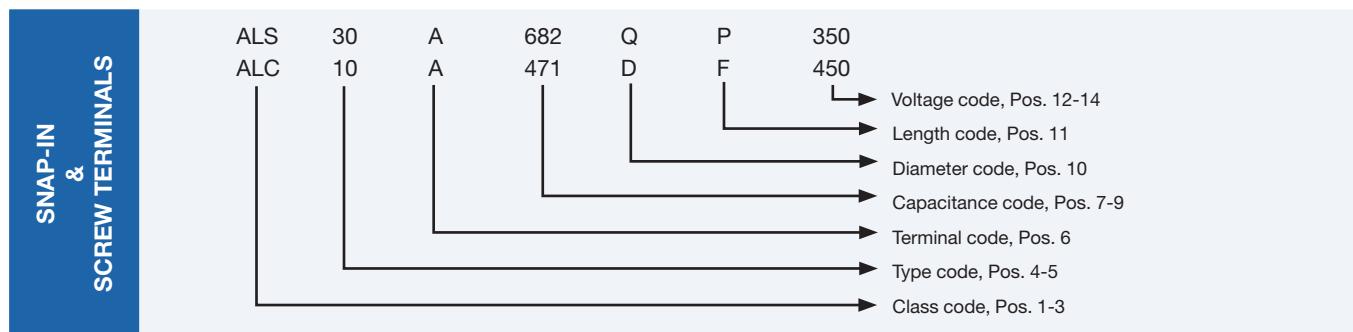

General ordering information

The BHC article code consists of 3 formats for the principle capacitor types. Where a part is required which has one or more attribute(s) that are non standard, e.g. capacitance/tolerance, case type, print detail, sleeve type & marking, bar code labelling, reduced ESR, etc., a customer special part number is assigned. In the simplest case, a special part may differ from a standard part by having the customer part number on the print detail. A special part number also makes it more difficult for third party copying as the technical specification will not be disclosed without written consent from the originating customer.

Standard part number with two digit case code

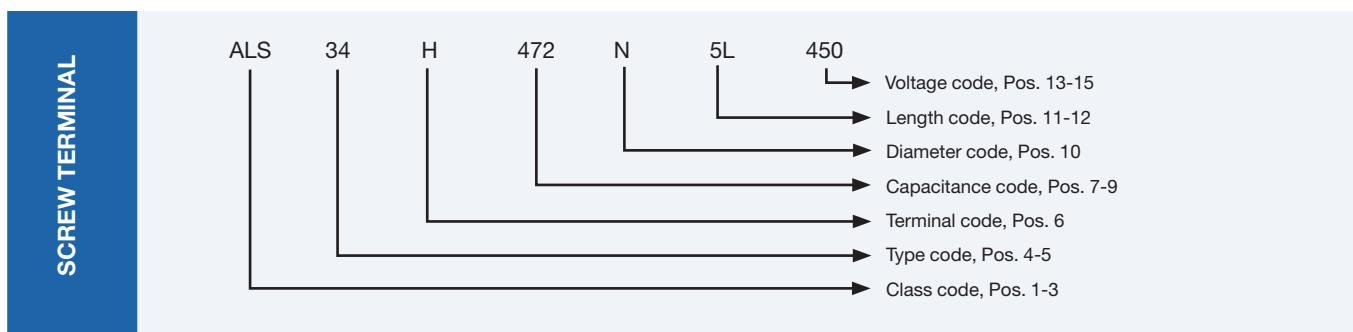

Pos 1-14

A	L	S	3	0	A	6	8	2	Q	P	3	5	0
1	2	3	4	5	6	7	8	9	10	11	12	13	14

**Standard part number with three digit case code**

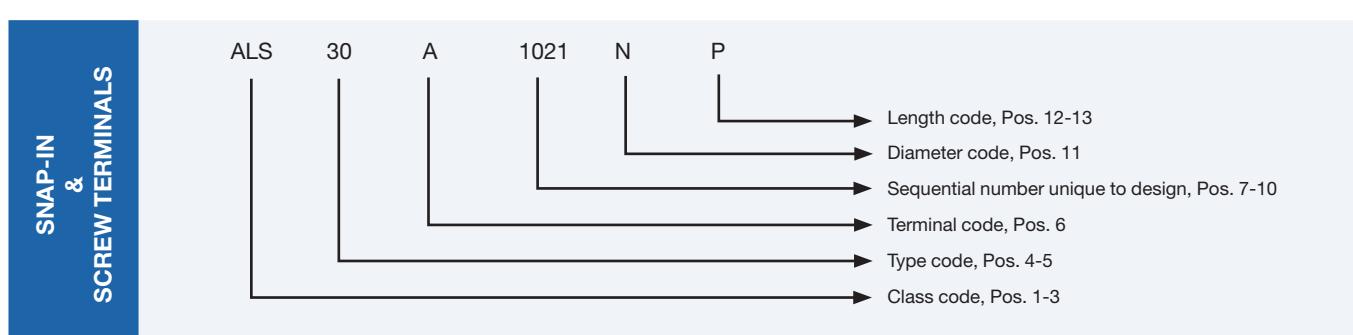

Pos 1-15

A	L	S	3	4	H	4	7	2	N	5	L	4	5	0
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

**Customer special part number**

Pos 1-13

A	L	S	3	0	A	1	0	2	1	N	P	
1	2	3	4	5	6	7	8	9	10	11	12	13

PART NUMBERING INFORMATION

BHC ELECTROLYTIC CAPACITORS

Class code:

"AL" = BHC Aluminium electrolytic capacitors
 "S" = Screw terminals
 "C" = Snap-in terminations
 "P" = Solder pin (DIN) terminations
 "T" = Solder tag terminations
 "N" = T-Network

Type code:

Type code indicates performance and plain can or stud mounting
 Plain can: 10,12, 20, 22, 30, 32, 34, 40, 42
 Studded: 11, 21, 23, 31, 33, 35, 41

Terminal code:

The terminal code is defined for each Class code.

ALS	ALC	ALP	ALT	ALN
A = M5 C = M6 E = 1/4-28UNF G = M6 HP High current H = 10-32UNF J = M6 LP High current M = M5 HP R = M5 Rifa	A = 2 pin 6.3mm C = 4 pin 6.3mm D = 2 pin 4.0mm E = 4 pin 4.0mm F = 3 pin 4.0mm G = 5 pin 6.3mm H = 5 pin 4.0mm J = 4 pin stand-off K = 5 pin stand-off S = 2/4 pin slotted foil	A = all types	A = all types	S = 4 pin

Capacitance code:

First two digits equals first two significant figures.
 Third digit is number of zeros.

Example: 272 = 2,700 µF
 104 = 100,000 µF.

Diameter code:

The diameter code is defined according to the following Class codes.

code	D	K	L	M	N	Q
ALS	ø36	ø51	ø64	ø66	ø77	ø90

code	B	C	D	E	F	K
ALC	ø25	ø30	ø35	ø40	ø45	ø50

code	A	B	C	D
ALP/T/N	ø25	ø30	ø35	ø40

Length code:

The length code is defined according to the class code, however, some type codes within a class have different length codes.

code	A	B	C	D	E	H	F	P	T
ALS30/40	52	62	67	75	82	98	105	146	220

code	2C	2L	3C	3L	4C	JA	4L	5C	5L	5R	6L	7L	8L
ALS32/34	55	68	80	93	105	115	119	131	144	150	169	194	220

code	B	C	D	E	F	G	H	L	P
ALC	30	35	40	45	50	55	60	80	105

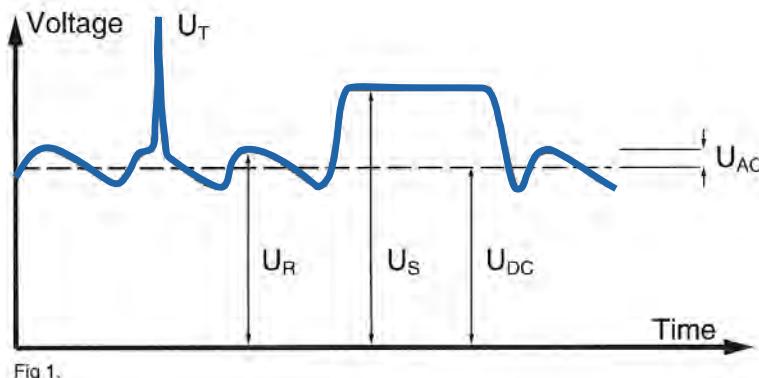

code	A	B	D	E	F
ALP/T/N	35	45	55	75	105

Voltage code:

Rated voltage code;
 e.g. 040 = 40Vdc, 450 = 450Vdc

TERMS AND DEFINITIONS

Term	Symbol	Unit	Definition	Notes
Rated voltage	U_R	V	Maximum operating peak voltage of a non reversing type waveform for which the capacitor has been designed for continuous operating. Figure 1.	Figure 1.
DC voltage	U_{DC}	V	The mean value of the applied DC-voltage. Figure 1.	
Superimposed AC-voltage	U_{AC}	V	Maximum superimposed alternating voltage applied. Figure 1.	$U_{DC} + U_{AC} \leq U_R$
Rated reversed voltage	U_{RE}	V	The maximum permitted reverse voltage (not in continuous operation).	$U_{RE} \leq 1.0V$
Surge voltage	U_s	V	A peak voltage induced by a switching or any other disturbance of the system which is allowed for a limited number of times. Figure 1.	$1.15 \times U_R$ for $U_R \leq 315V$ $1.10 \times U_R$ for $U_R > 315V$ 1000 cycles with load period 30s and no load period 330s, $R \times C = 0.1s$.
Transient voltage	U_T	V	Some of our capacitors can withstand pulses exceeding the surge voltage. (No general ratings, value on request)	Rise time t_R , $100 \mu s < t_R < 5 ms$ Time between transients $> 5 min$. Nominal voltage applied between transients. 1000 pulses randomly applied during life time.

Rated capacitance	C_R	F	The rated capacitance is the value which is indicated upon the capacitor.	Measured at $\leq 0.5V$ and 100 Hz without DC polarization, 20°C.
DC capacitance	C_{DC}	F	The capacitance determined on basis of the capacitors storage capacity when charged with DC voltage.	Measured acc. to DIN 41328.
Impedance	Z	Ω	Impedance between capacitor terminals.	Determines output ripple voltage.
Equivalent series resistance	R_{ESR}	Ω	An equivalent resistance in series with the ideal capacitor representing all the losses of the capacitor.	Maximum R_{ESR} is stated at 100 kHz and 100 Hz, 20°C.
Equivalent series inductance	L_{ESL}	H	An equivalent inductance in series with the ideal capacitor representing the inductance of the winding and the terminals.	Partly determines impedance at high frequencies.
Dissipation factor	$\tan\delta$		Measure for the deviation from an ideal capacitor.	Maximum $\tan\delta$ available on request.

TERMS AND DEFINITIONS

Term	Symbol	Unit	Definition	Notes
Rated ripple current	I_{RAC}	A	Maximum rms current for continuous operation at specified service conditions.	I_{RAC} is stated at 100 Hz and upper category temperature. See Article Table.
Ripple current	I_{AC}	A	Applied ripple current at operating frequency and operating temperature.	For calculation of k_{AC} and k_{PC} .
Leakage current	I_{RL}	A	The leakage current is the current after a specified time flowing through the capacitor when a direct voltage is applied across the terminals.	Rated value (at 20°C, U_R applied, 5 minutes).
Operational leakage current	I_{OL}	A	The final direct current that appears after a prolonged operating time.	Measured after approximately 30 minutes.
Temperature range		°C	The ambient temperature interval between a lower and upper temperature limit to which the capacitor may be continuously exposed in order to function with specified parameter tolerances.	See Article Table.
Storage temperature	T_s	°C	A temperature at which the capacitor can be stored without any applied voltage and without any damage to the capacitor.	Minimum storage temperature is -55°C. Storage life at 40°C without reforming 10 years.
Ambient temperature	T_a	°C	The temperature around the capacitor.	
Case temperature	T_c	°C	The hottest part of the case.	
Hot-Spot temperature	T_h	°C	The hottest part of the winding.	Determines life, reliability and max permitted ripple current.
Shelf life		h	Shelf life is specified time for which a capacitor can be stored with no applied voltage.	See article table for each group.
Operational life	L_{OP}	h	The operational life designates the period that is achieved until the electrical parameters exceed certain values. During this time the failure rate is constant.	Operational life is defined as: $10 \leq U_R \leq 160V$ $\Delta c/c \leq \pm 15\%$ $U_R > 160V$ $\Delta c/c \leq \pm 10\%$ $\tan\delta \leq 1, 3 \tan\delta$ (specified value) $I_L \leq I_{RL}$, $R_{ESR} \leq 2R_{ESR}$ (initial value).
Failure rate	λ	h^{-1}	The failure rate is the fraction failure divided by the specified time of duty.	The failure rate is divided from our periodic tests. Therefore the failure rate is only given at the test temperature for life tests. An estimation is also given at 60°C.

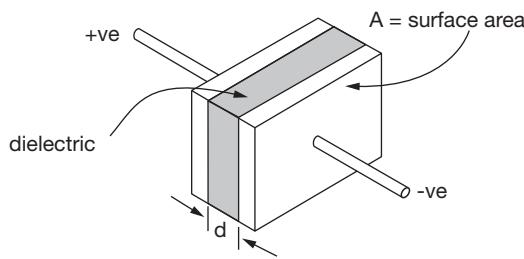

CAPACITOR CONSTRUCTION

Basic Construction of a Capacitor

The basic principle of the capacitor is to store electrical charge (Q in coulombs). The potential charge it can hold is determined by the capacitance (C in Farads) and voltage (V in volts) and is defined as:

$$Q = C \cdot V$$

The unit of capacitance, the Farad, is the capacitance of the capacitor between the plates across which there appears a potential difference of 1 volt when it is charged by 1 coulomb of electricity. The value of capacitance in a basic capacitor is proportional to the area of the plates and inversely proportional to the distance between them. Not only does this distance between the plates have an effect on capacitance but also the material that occupies the space, known as the dielectric.

If the space were to be occupied by a perfect vacuum then the capacitance can be determined by:

$$C = \frac{\epsilon_0 \cdot A}{d}$$

A = surface area of the plates in m^2
 d = distance between the plates
 (or dielectric thickness) in m

ϵ_0 = permittivity of free space - $8.85 \times 10^{-12} F/m$

In practice this space is occupied by a dielectric which has a relative permittivity to that of the vacuum as follows:

Material	Relative Permittivity
Vacuum	1.0
Air	1.0006
Paper (dry)	2 - 2.5
Polythene	2 - 2.5
Insulating oil	3 - 4
Bakelite	4.5 - 5.5
Glass	5 - 10

Therefore capacitance is determined by:

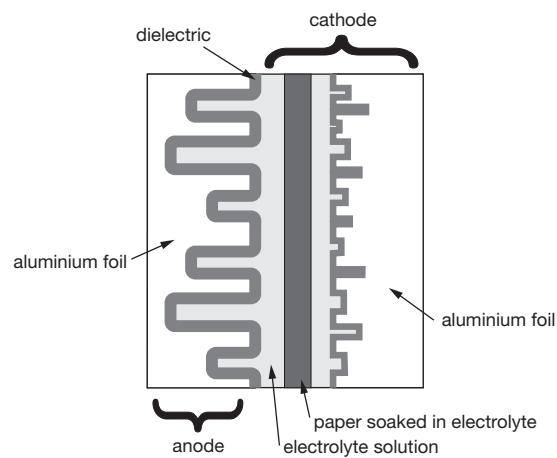

$$C = \frac{\epsilon_0 \cdot \epsilon_r \cdot A}{d}$$

ϵ_r = relative permittivity of the dielectric

Aluminium Electrolytic Capacitors

The aluminium electrolytic capacitor consists basically of two foils interleaved with an absorbent paper wound tightly into a cylinder. The main advantage of this type of capacitor is the high capacitance per unit volume due to its internal construction which consists of a very thin dielectric layer and large effective surface area.

The positive plate, or anode, is made from aluminium foil which is etched to increase the surface area. The dielectric is aluminium oxide, which is formed electrolytically onto the surface of the foil. This formed oxide layer is very thin, being proportional in thickness to the forming voltage and possesses a semiconductor characteristic. The oxide thickness for a 25 volt working capacitor is in the order of 0.045 microns.

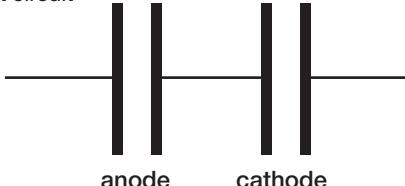

The negative plate, or cathode, is provided by an electrolyte solution for two reasons:

- allows good contact with the anode by permeating all the etched structure.
- repairs any flaws in the oxide layer when the capacitor is polarised.

The second foil, usually called the cathode foil, contacts with the electrolyte reducing the series resistance. This foil has a thin stabilized oxide film, and therefore will also possess a very high capacitance. Like the anode foil the cathode is also etched to increase the surface area. This is necessary in order to eliminate the effect on the overall capacitance by the presence of the cathode foil.

equivalent circuit

$$\frac{1}{C_{\text{total}}} = \frac{1}{C_{\text{anode}}} + \frac{1}{C_{\text{cathode}}}$$

MANUFACTURING PROCESS

The manufacturing process begins with the anode foil being electrochemically etched to increase the surface area and then 'formed' to produce the aluminium oxide layer.

Both the anode and cathode foils are then interleaved with absorbent paper and wound into a cylinder. During the winding process aluminium tabs are attached to each foil to provide the electrical contact.

The deck, complete with terminals, is attached to the tabs and then folded down to rest on top of the winding.

The complete winding is impregnated with electrolyte before being housed in a suitable container, usually an aluminium can, and sealed. Throughout the process all materials inside the housing must be maintained at the highest purity and be compatible with the electrolyte.

Before being sleeved and packed each capacitor is aged and tested. The purpose of ageing is to repair any damage in the oxide layer and thus reduce the leakage current to a very low level. Ageing is normally carried out at the rated temperature of the capacitor and is accomplished by applying voltage to the device whilst carefully controlling the supply current. The process may take several hours to complete. Damage to the oxide layer can occur due to variety of reasons:

- slitting of the anode foil after forming
- attaching the tabs to the anode foil
- minor mechanical damage caused during winding

After completion of the production process a sample from each batch is taken by the quality department. This sample size is controlled by the use of recognised sampling tables defined in BS 6001.

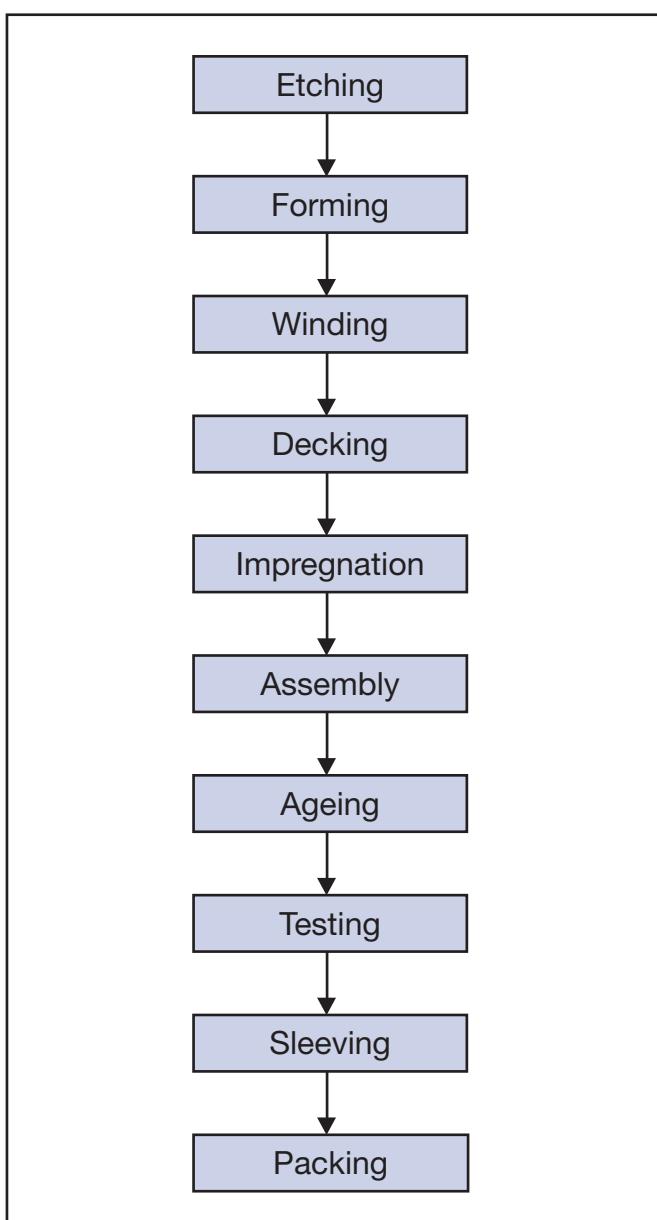

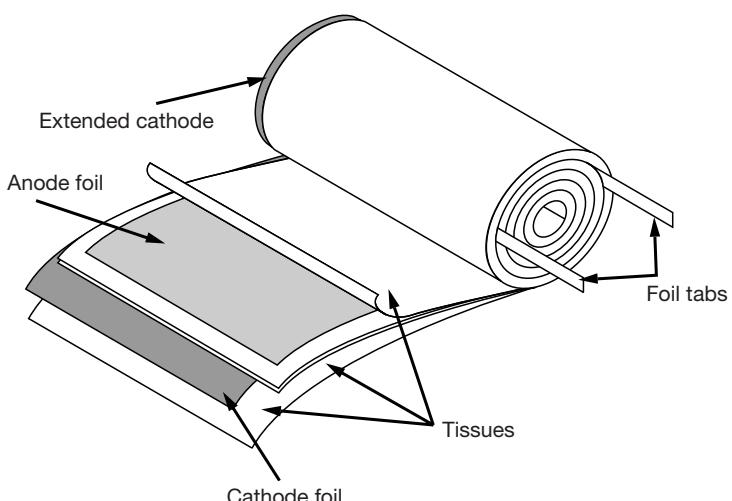

The following tests are applied and may be varied at the request of the customer. In this case the batch, or special procedure, will determine the course of action:

Electrical:

- Leakage current
- Capacitance
- ESR
- Impedance
- Tan Delta

Mechanical/Visual:

- Overall dimensions
- Torque test of mounting stud
- Print detail
- Box labels
- Packaging, including packed quantity

APPLICATION AND OPERATION OF ELECTROLYTIC CAPACITORS

Selection of an electrolytic capacitor for reliable operation in a particular application should be based on a complete working condition specification. This chapter will give some guidelines on how to select electrolytic capacitors.

INTRODUCTION

An electrolytic capacitor used for smoothing, energy storage or filtering of a rectified AC voltage will be loaded with an AC ripple current causing a power loss and heating of the capacitor.

The temperature in the hottest part, the Hot Spot, inside the capacitor, is the major factor influencing operational life. The Hot Spot temperature is dependent upon several factors.

- Power loss caused by AC current
- Thermal resistance between the Hot Spot and the ambient
- Ambient temperature and capacitor cooling condition.

Evox Rifa / BHC's electrolytic can types and axials are designed for operation under severe climatic conditions and for heavy ripple current load. This requires low internal losses and an efficient heat transfer between the capacitor "Hot Spot" and the ambient.

The internal thermal design and the method of mounting the capacitor are therefore of equal importance for reliability and operational life together with the capacitor's electrical design.

Long term high parameter stability is the key to Long Life, and the ability to withstand high temperature and high ripple current. The power loss P in the capacitor can be calculated from:

$$P = R_{ESR} \times I_{AC}^2$$

R_{ESR} is dependent on the frequency f, and winding temperature. With complex current waveform it is therefore necessary to calculate the contribution from each harmonic frequency to the power loss.

$$P = R_{ESR}(f_1)xI_{AC}^2(f_1) + R_{ESR}(f_2)xI_{AC}^2(f_2)(W)$$

The thermal resistance R_{th} , ($^{\circ}\text{C}/\text{W}$), of a capacitor is defined from the power loss P and the temperature difference; ΔT , between the Hot Spot temperature, T_h and the ambient temperature, T_a , in the thermal equilibrium,

$$\Delta T = P \times R_{th}$$

$$\Delta T = T_h - T_a$$

The power P is assumed to be generated in the Hot Spot.

R_{th} (total thermal resistance) can be divided in two parts. R_{thhc} is the inner thermal resistance between the Hot Spot and the case. R_{thca} is the outer thermal resistance between the case and the ambient.

$$\Delta T = P \times (R_{thhc} + R_{thca})$$

R_{thhc} is dependent on the capacitor design, R_{thca} is dependent on cooling conditions. In electrolytic capacitors, heat generated in the winding is easily transferred in the axial direction. With this design a very low R_{thhc} is achieved and thus a very low temperature difference between the Hot Spot and the case.

The operational life of Long Life electrolytic capacitors is dependent upon the evaporation of electrolyte through the seal.

At voltages up to rated voltage and at high temperatures there are practically no other factors that influence the life of the capacitors. Sealing materials are selected for a minimum of diffusion losses.

Even if the Hot Spot temperature, T_h determines service life, the case temperature, T_c is better suited as a reference temperature for the calculation of service life. T_c is the temperature of a well defined surface area (the bottom of the case beneath the insulation). It is easily measured when e.g. effect of forced cooling is determined. For a certain power loss P the temperature difference between T_h and T_c is a constant.

$$T_h = T_c + P \times R_{thhc}$$

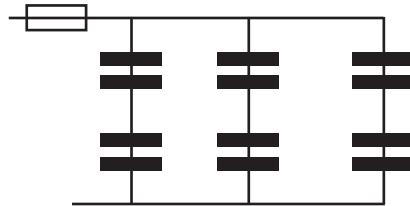

Full details on the selection and use of shunt resistors can be found in the separate application notes produced by Evox Rifa / BHC.

In parallel operation, particularly large, high voltage banks, the possibility of capacitors discharging into each other may entail special precautions in certain applications.

Series/Parallel Bank Protection

There are three major configurations to consider in protecting a series/parallel bank of capacitors. The advantages and disadvantages of each are outlined below but the final choice must be made by the equipment designer.

OPTION 1 - Fusing for whole bank

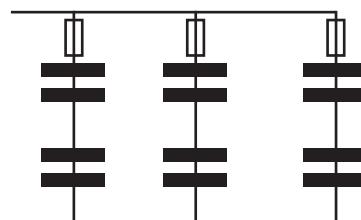

Advantages

- Simple construction
- Inexpensive

Disadvantages

- Only offers basic protection
- Cannot protect against internal discharges within bank

OPTION 2 - Individual capacitor fuses

Parallel and Series Operation

Special considerations arise when electrolytic capacitors are used in series or parallel banks.

In series operation, matching of capacitance values may be necessary to avoid imbalance during charging and discharging mode. Steps must be taken to ensure adequate d.c. voltage distribution while biased, either by providing shunt resistors to compensate for inequalities in capacitor d.c. leakage currents, or some other means.

There are two major configurations to consider when constructing a series/parallel bank of capacitors - individual balancing resistors and common centre connection. Individual balancing resistors afford greater protection for the capacitors if one becomes short circuit but is more complex to construct and expensive. Common centre connections give improved balancing during steady state and transient conditions but offer the possibility of exposing one half of the bank to full voltage should one capacitor short circuit.

Advantages

- Removes faulty capacitor from circuit

Disadvantages

- Expensive
- Complex assembly (busbars and fuses)

OPTION 3 - Electronic monitoring

Advantages

- May prevent serious failure by early shut down of equipment
- Optional bank discharge mechanism to prevent capacitors dumping charge into failed capacitor

Disadvantages

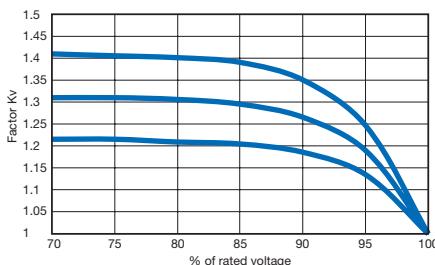

- Must be designed into control circuitry
- Complex and expensive

APPLICATION AND OPERATION OF ELECTROLYTIC CAPACITORS

Voltage Deration

If capacitors are operated at a voltage below their rated value then the reduced stress and lower leakage current will give an improvement in the life expectancy.

Since leakage current increases with temperature the benefit of a reduced operating voltage is more pronounced at higher temperatures. The graph below shows the voltage deration factor (Kv) for products with a rated temperature of 85°C and core temperatures (Tc) of 45°C, 65°C and 85°C.

The life expectancy of a capacitor at full rated voltage is multiplied by the voltage deration factor to obtain the new life expectancy at the lower operating voltage:

$$Le_{(V_{op})} = Le_{(V_r)} \times Kv$$

Le_(V_{op}) - Life expectancy at operating voltage

Le_(V_r) - Life expectancy at rated voltage

Kv - Voltage deration factor

Polarity and Reversed Voltage

Aluminium Electrolytic capacitors manufactured for use in d.c. applications contain an anode foil and a cathode foil. As such they are polarised devices and must be connected with the +ve to the anode foil and the -ve to the cathode foil. If this were to be reversed then the electrolytic process that took place in forming the oxide layer on the anode would be recreated in trying to form an oxide layer on the cathode. In forming the cathode foil in this way heat would be generated and gas given off within the capacitor usually leading to catastrophic failure.

The cathode foil already possesses a thin stabilised oxide layer, this thin oxide layer is equivalent to a forming voltage of approximately 2V. As a result, the capacitor can withstand a voltage reversal of up to 2V for short periods. Above this voltage the formation process will commence.

Aluminium electrolytic capacitors can also be manufactured for use in intermittent a.c. applications by using two anode foils in place of one anode and one cathode.

Case Polarity - due to the presence of electrolyte in the capacitor the aluminium can, stud mounting and any dummy pins will essentially be at the same potential as the negative terminal. It is therefore recommended that they are either:

- left unconnected
- connected to the same potential as the negative terminal
- insulated

Mounting

All aluminium electrolytic capacitors incorporate a safety vent, in order to relieve build up of internal pressure due to over stress or catastrophic failure. For the smaller ranges, such as snap-in or solder pin types, this takes the form of a weakened area in the side or base of the can. For the larger, screw terminal types the vent is incorporated in the deck.

In all cases consideration must be given, when mounting the capacitor, to the operation of the vent under failure conditions. It is recommended that capacitors are always mounted with the safety vent uppermost, or in the upper part of the device. Should the vent operate with the least amount of electrolyte will then be expelled.

It is worth noting that screw terminal capacitors may be mounted in any position so long as the vent can operate. The operational and parametric performance is totally unaffected by the physical orientation but should the vent operate with the capacitor mounted upside down then a few drops of electrolyte may be expelled.

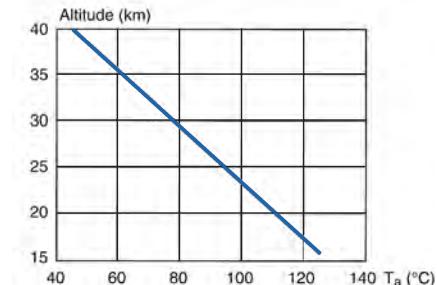

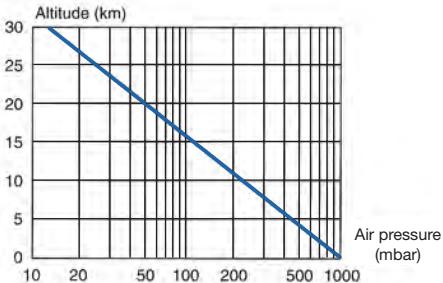

Board mounting types are designed to be mounted by their terminals alone. Larger types may have dummy pins for extra rigidity. Screw terminal and tag ended types may be fixed with a base stud or suitable mounting clamp.

Adequate space should be allowed between components for cooling air to circulate, particularly when high ripple currents are being applied.

Altitude and Low Air Pressure

If a capacitor is operated at altitude, the life will be affected slightly for two reasons. Convected heat loss will be reduced as the air density falls resulting in the capacitor running hotter with a consequent reduction in life.

As the air pressure drops the differential between the internal case pressure and external pressure increases. A complete vacuum would cause the internal pressure to rise by 15 psi (approx.). If maintained this would lead to increased electrolyte vapour loss and give a slight reduction in life expectancy.

Maximum altitude as a function of the ambient temperature (T_a)**Air pressure as a function of the altitude**

SHELF LIFE AND RE-AGEING

Shelf Life

The capacitance, ESR and impedance of a capacitor will not change significantly after extended storage periods, however the leakage current will very slowly increase. Evox Rifa / BHC products are particularly stable and allow a shelf life in excess of three years at 40°C. See sectional specification under each product series for specific data.

Re-age (Reforming) Procedure

Apply the rated voltage to the capacitor at room temperature for a period of one hour, or until the leakage current has fallen to a steady value below the specified limit. During re-ageing a maximum charging current of twice the specified leakage current or 5mA (whichever is greater) is suggested.

CLEANING OF ELECTROLYTIC CAPACITORS

Cleaning of electrolytic capacitors

Aluminium electrolytic capacitors are susceptible to damage by certain types of cleaning solvents. Cleaning solvents that contain halogenated hydrocarbons especially chlorinated hydrocarbons are generally not recommended. The solvents can diffuse through the seal into the capacitor, and are then converted electro-chemically to free chlorides, which can cause corrosion. This can result in a pressure build-up that can destroy the capacitor.

Cleaning solvents that can be used without precautions

- 1) Cleaning solvents such as alcohols (e.g. isopropanol, methyl-, ethyl-, propyl-, or butyl alcohol), glycol ethers (e.g. methylglycol) or ethylacetate are recommended.
- 2) If the other components on the circuit board are washable with water, water with a mild detergent is recommended as the mildest cleaning solvent. However, this procedure should be followed by immediate drying in hot air +85°C for 5–10 min.

to avoid hydroxide precipitation on the surface of the can.

Halogenated Hydrocarbons contain CFC's and as such are ozone depleting chemicals (ODC's). It is not recommended that they are used as cleaning solvents. In addition these solvents can be injurious to electrolytic capacitors by absorption into the rubber seals followed by subsequent diffusion into the case, and attack of the winding, leading to premature failure.

EVOX RIFA QUALITY

The quality of Evox Rifa's products and services is based on a continuous strive towards excellency throughout the whole organization. Skilled and motivated personnel, technical know-how and modern equipment combined with extensive quality assurance make Evox Rifa the supplier of components of the highest quality.

The up-to date quality tools like Statistical Process Control (SPC) in various forms, Failure Mode and Effect Analysis (FMEA), Accelerated Reliability Testing and Zero Defect Acceptance concept in final testing are the corner stones of the every day quality work. Cross-functional teams are routinely used in Problem Solving (8D method) with effective Failure Analysis support.

As a visible evidence of our quality, all the manufacturing units world wide are certified according to ISO 9001. In addition to that, the relevant factories have the automotive industry's QS9000 certifications, which is in process to be upgraded to ISO TS 16949 during 2006. The Finnish factory has

also IECQ approval. Our well known EMI suppression capacitors carry the important safety marks for world wide applications.

Evox Rifa companies have the following certificates:

Customer in Focus

The only real measure of our total quality performance is the acceptance of our customers.

Evox Rifa's quality work has always been focused on the customer. We have actively made quality agreements with ambitious goal settings with World-Class Companies – small and large.

This active quality cooperation has been most fruitful to Evox Rifa by bringing in most modern quality tools, but especially by providing us with reliable feedback on the performance quality of our products and services.

The cooperation has not only lead to continuous improvement of the quality of our products, but sometimes also helped our customers to spot some weaknesses in their designs. A visible sign of these close links between Evox Rifa and various customers is the numerous prestigious customer approvals and the performance awards addressed to Evox Rifa and BHC Components.

CERTIFICATES FOR THE BUSINESS AREA ELECTROLYTIC CAPACITORS

RELIABILITY

Reliability

The reliability of a component can be defined as the probability that it will perform satisfactorily under a given set of conditions for a given length of time.

In practice it is impossible to predict, with absolute certainty, how any individual component will perform, we must utilise probability theory. It is also necessary to clearly define the level of stress involved (e.g. operating voltage, ripple current, temperature and time). Finally the meaning of satisfactory performance must be defined by specifying a set of conditions which determine the end of life of the component.

Reliability as a function of time, $R(t)$, is normally expressed as:

$$R(t) = e^{-\lambda t}$$

where $R(t)$ is the probability that the component will perform satisfactorily for time t , and λ is the failure rate.

Failure Rate

The failure rate is the number of components failing per unit time. The failure rate of most electronic components follows the characteristic pattern:

Early failures are removed during the manufacturing process.

The operational life is characterised by a constant failure rate.

The wear out period characterised by a rapidly increasing failure rate.

The failures in time (FIT) are given with a 60% confidence level for the various type codes. By convention, FIT is expressed as 1×10^{-9} failures per hour. Failure rate is also expressed as a percentage of failures per 1000hours.

eg. $100\text{FIT} = 1 \times 10^{-7}$ failures per hour
 $= 0.01\% / 1000 \text{ hours}$

Type FIT @ 40°C

ALC1_	12
ALC4_	12
ALS3_	12
ALS4_	12
ALP_	22
ALT_	22

Type FIT @ 60°C

PEH200	100
PEH169	100

End of life Definition

Catastrophic Failure: short circuit, open circuit or safety vent operation.

Parametric Failure:

change in capacitance $> \pm 10\%$

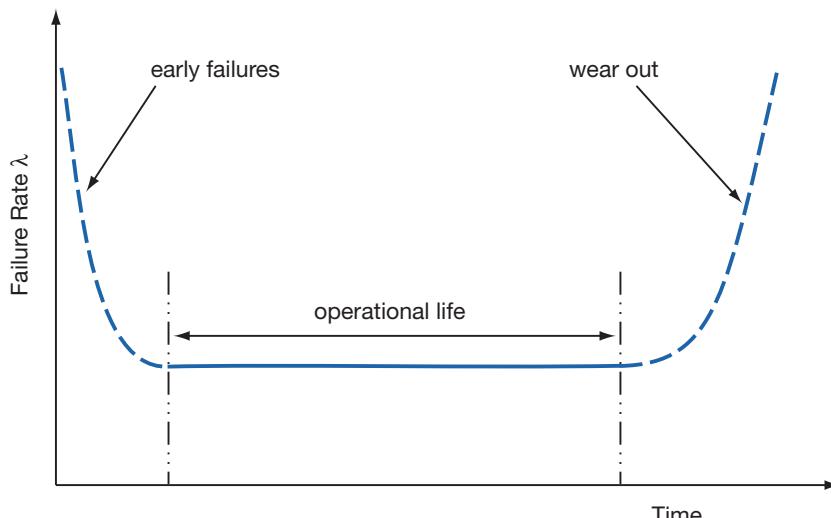

Leakage current $>$ specified limit

ESR $> 2 \times$ initial ESR value

MBTF

The mean time between failures (MBTF) is simply the inverse of the failure rate.

$$\text{MTBF} = 1/\lambda$$

ENVIRONMENTAL COMMITMENT

As an environmentally conscious company, Evox Rifa (including BHC Components) is working continuously with improvements concerning the environmental effects of both our capacitors and the production of them.

In Europe (RoHS Directive) and in some other geographical areas like China, legislation has been put on place to prevent the use of some hazardous materials, like Lead (Pb), in electronic equipment. All products in this catalogue are produced to help our customer's obligations to guarantee their products to fulfil these legislative requirements. The only material of concern in our products has been Lead (Pb), which has been removed from all designs to fulfil the requirement of

containing less than 0,1% of Lead in any homogeneous material.

Evox Rifa will follow closely any changes in legislation world wide, and makes any necessary changes in its products, whenever needed.

Some customer segments like Medical, Military and Automotive Electronics may still require e.g. the use of Lead in electrode coatings. To clarify the situation, and to distinguish products from each other, a special symbol is used on the packaging labels for RoHS compatible capacitors. See pictures to the right.

Because of customer requirements there may appear additional markings like LF = Lead Free or LFW = Lead Free Wires on the label.

Compliant

RoHS Compliant

Examples of RoHS Compliance markings on packaging labels

PRODUCT SAFETY

THESE NOTES SHOULD BE READ IN CONJUNCTION WITH THE PRODUCT DATA SHEET. FAILURE TO OBSERVE THE RATINGS AND THE INFORMATION ON THIS SHEET MAY RESULT IN A SAFETY HAZARD.

WARNING

When potentially lethal voltages e.g. 30V a.c. (r.m.s) or 60V d.c. are applied to the terminals of this product, the use of a hazard warning label is recommended. In the case of motor start capacitors they meet the requirements of British Standard Specifications BS.5267: 1976 and reference should be made to Appendix C -Guide for installation and operation.

1. ELECTROLYTE

Aluminium electrolytic capacitors contain liquids (electrolytes) which can be hazardous. The electrolytes are conducting solutions of organic and/or boric acid, neutralised with amines or ammonia, in a variety of solvents. The major solvents are butyrolactone and ethylene glycol. Co-solvents e.g. N-methyl pyrrolidone may be present. Inorganic or organo-phosphates are present in low concentration. The physical, chemical and toxicological properties of the electrolytes are largely determined by the solvents, as summarised below:

Physical Properties

1. Low viscosity - typically 5 - 50 cp at 25°C
2. Combustible - Flash points 95 - 120°C
3. Low vapour pressure -< 20mm Hg at 25°C

Chemical properties

1. Non-corrosive.
2. Can be aggressive to many plastics, lacquers and resins.
3. Totally soluble in hot water.

Toxicology

The electrolytes are moderately toxic, with LD50 values in the range 1.5 -2g/Kg. Skin exposure can cause drying and defatting. Severe irritation may be caused to the mucous membranes, particularly the eyes, where conjunctivitis may result.

Safety Precautions

In the event of electrolyte escape, wash the affected area with hot water. Use rubber gloves to avoid skin contact. Any contact with the eyes should be liberally irrigated with water, and medical advice sought.

Note - the electrolyte systems do not contain materials currently listed as carcinogenic, mutagenic or teratogenic, e.g. polychlorinated biphenyls (PCB's), dimethylformamide (DMF) or dimethylacetamide (DMA).

2. INTRINSIC PROPERTIES**Operating**

D.C. capacitors are polar devices, and will operate safely only if correctly connected. Reversing the connections will result in high leakage currents which could subsequently cause short circuit failure, rupture of the safety vent and possibly explosion and fire.

Correctly polarised operation may result in the above failure modes if:

- the surge voltage is exceeded.
- the ambient temperature is too high.
- excessive ripple currents are applied.

A.C. types are non-polar. Catastrophic failure may be caused by:

- Abnormal duty cycles.
- Voltage in excess of rated value.
- Ambient temperature too high.

Non Operating

Aluminium electrolytic capacitors contain liquids which can leak out (see material content).

Damage to the encapsulation may cause leakage of the electrolyte. Excessive torque or soldering heat may affect the performance of the capacitor or damage the sealing.

Electric shock may result if capacitors are not discharged.

3. FLAMMABILITY

Most plastics and elastomers are combustible i.e. will ignite if an ignition source is applied under suitable conditions of temperature and oxygen level.

For most published data, the UL94 Horizontal or Vertical Burning System has been applied. Although useful for comparative values, this test is not practicable, as the ignition characteristics are strongly influenced by the material dimensions, and other materials with which they may be in intimate contact. Evox Rifa / BHC has completed a series of flammability tests based on a Needle Flame Test, as specified in IEC 60695-2-2. Details of the tests undertaken on both the external components and internal wind elements, can be found in a full technical article, TD005, "Flammability Characteristics" contained within BHC "Aluminium Electrolytic Capacitors – Application Notes".

4. DISPOSAL

Aluminium Electrolytic Capacitors are consignable waste under the Special Waste Regulations 1996 (Statutory Instrument 1996 No 972), which complies with the EC Hazardous Waste Directive – Directive 91/689/EEC. The electrolyte should therefore be treated as a hazardous waste and advice should be sought from the local office of the Environmental Agency regarding its disposal. In the United Kingdom there are two possible methods of disposal; high temperature incineration

and landfill, from which the user should seek the best practicable environmental option.

Due to the construction of an aluminium electrolytic capacitor, high temperature incineration may cause the component to explode due to build-up of internal pressure. In addition, incineration may also cause the emission of noxious fumes. If it is decided that this is the best practicable option then it must be carried out under controlled conditions and at a minimum temperature of 1200°C. It should also be confirmed that the incinerator is authorised under parts A or B of the Environmental Protection Act.

The alternative is to dispose of them in an engineered lined landfill site that is licensed to take materials identified on the safety sheet. It should be stressed that these capacitors are not to be disposed of in a land fill site set aside for domestic waste.

Evox Rifa / BHC strongly recommend that if there are any doubts regarding the disposal of aluminium electrolytic capacitor, that advice be sought from the local regulating authority.

In addition, Evox Rifa /BHC would like to request that users of aluminium electrolytic capacitors respect the needs of the environment and wherever possible recover as much of the materials as possible, i.e. aluminium.

5. UNSAFE USE

Most failures are of a passive nature and do not represent a safety hazard. A hazard may, however, arise if this failure causes a dangerous malfunction of the equipment in which the capacitor is employed. Circuits should be designed to fail safe under the normal modes of failure.

The usual failure mode is an increase in leakage current or short circuit. Other possible modes are decrease of capacitance, increase in dissipation factor (and impedance) or an open circuit.

Capacitors should be used in a well-ventilated enclosure or cabinet.

7. MOUNTING

Care should be taken when mounting by clamp, that any safety vent in the can is not covered.

8. FUMIGATION

In many countries throughout the world it is now common practice to fumigate shipments of products in order to control insect infestation, particularly when wooden packaging is used. Currently methyl bromide is widely used as a fumigant and this can penetrate cardboard packing and polymer bags and therefore come into direct contact with equipment or components contained within.

PRODUCT SAFETY

FUMIGATION continued

If aluminium electrolytic capacitors become exposed to methyl bromide then corrosion may occur depending upon the concentration and exposure time to the chemical.

This failure mode can affect all types of Evox Rifa / BHC aluminium electrolytic capacitors. Methyl bromide can penetrate the seals of aluminium electrolytic capacitors and cause internal corrosion of the anode connection resulting in the component becoming open circuit. The rate of corrosion will depend upon the level of exposure to methyl bromide and

also the subsequent operating conditions such as voltage and temperature. It may take months, or in some cases several years, before the component becomes open circuit.

9. DIELECTRIC ABSORPTION

A phenomenon known as dielectric absorption can cause aluminium electrolytic capacitors to re-charge themselves. The phenomenon is well known but impossible to predict with any great accuracy and so potentially any electrolytic product could be affected. Thus, a capacitor, which has been charged and then completely discharged, will appear to re-charge itself, if left open

circuit and this will manifest itself as a small voltage across the terminals of the capacitor. Generally the voltages seen are less than 20Vdc, however higher voltages have on occasion been reported.

In order to avoid any problems caused by this voltage Evox Rifa / BHC recommends that capacitors be discharged before connecting to the terminals.

FLAMMABILITY

Most plastics and elastomers are combustible i.e. will ignite if an ignition source is applied under suitable conditions of temperature and oxygen level.

For most published data, the UL 94 Horizontal and Vertical Burning system has been applied. Although useful for comparative values, this test is not practicable, as the ignition characteristics

are strongly influenced by the material dimensions, and other materials with which they may be in intimate contact.

The electrolytic capacitors manufactured and Evox Rifa Group withstand the fire hazard test according to IEC 60695-2-2 with a 30s flame exposure and the requirement to be self retardant within 10s.

The electrolytes used are not classified as flammable according to ASTM (American Society for Testing and Materials). The electrolytes are classified as combustible.

For the voltage ranges of 385V to 450V a special non flammable self-extinguishing electrolyte system is available for ALS ranges on request.

PEG 124 125°C and 105°C

**RoHS
Compliant**

- **125°C and 105°C**
- **Long life > 30 years at 50°C**
- **Low ESR**
- **Low ESL**

APPLICATION

Smoothing, coupling/decoupling and energy storage in telecommunication, power supply system, data processing, process control and measuring where Long Life and high reliability are of paramount importance.

BASIC DESIGN

PEG 124 is an electrolytic capacitor with very Long Life and outstanding electrical performance. Polarized, all-welded design, tinned copper wire leads, negative pole connected to the case, plastic insulation. Long Life and very high reliability are achieved by the dimensioning of the capacitor, the careful selection of materials/methods and discipline in quality control allowing operation up to +125°C/105°C.

The PEG 124 winding is housed in a cylindrical aluminium can with a high purity aluminium lid and a high quality rubber gasket. The sealing system is designed for electrolyte leakage free operation and a very low gas-diffusion rate of electrolyte. Low ESR is a result of a low resistive electrolyte/paper system and an all-welded design. Thanks to its mechanical robustness the PEG 124 is also suitable for use in mobile and in aircraft installations.

OPERATIONAL LIFE AND RIPPLE CURRENT, PEG124 (125°C)

Operational life (L_{op}) at ambient temperature T_a and ripple current I_{AC} .

Diagram valid for Ø20 case size.

Operational life, Ø16 case size: $0.67 \times$ diagram value

Ø13 case size: $0.44 \times$ diagram value

Ø10 case size: $0.37 \times$ diagram value

Example:

Article: PEG124MG368AQ (Ø16 x 37 mm)

Ambient temperature (T_a): 85°C

Ripple current, at 10kHz (I_{AC}): 6.0 A

$$I_{RAC}(125^\circ\text{C}, \geq 5\text{kHz}) = 2.6 \text{ A (from data table)}$$

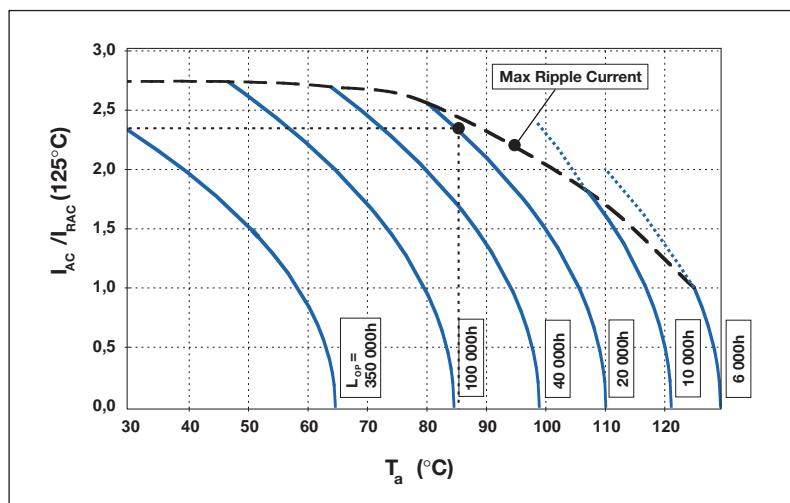

$$\rightarrow I_{AC}/I_{RAC}(125^\circ\text{C}) = 2.3$$

Operational life: Interpolation between the L_{op} -curves $\rightarrow L_{op} \sim 20 \text{ kh} \times 0.67 = 13 \text{ kh}$ (blue curves)

Ø16-factor

When the capacitor load is at 100Hz, use $I_{AC}/I_{RAC}(125^\circ\text{C}, 100\text{Hz})$ as input value to the diagram (see data table). At other frequencies use $I_{AC}/I_{RAC}(125^\circ\text{C}, \geq 5\text{kHz}) \times 1/\text{Corr} =$

Frequency correction factor, for ripple current (Corr):

FREQUENCY

300 Hz 1 kHz 5 kHz 100 kHz

	300 Hz	1 kHz	5 kHz	100 kHz
Correction factor (Corr) (Typical value)	0.57	0.80	1.00	1.04

OPERATIONAL LIFE AND RIPPLE CURRENT, PEG124 (105°C)

Operational life (L_{op}) at ambient temperature T_a and ripple current I_{AC} .

Diagram valid for Ø20 case size.

Operational life, Ø16 case size: $0.67 \times$ diagram value

Ø13 case size: $0.44 \times$ diagram value

Ø10 case size: $0.37 \times$ diagram value

Example:

Article: PEG124RL3150Q (Ø20 x 46 mm)

Ambient temperature (T_a): 79°C

Ripple current, at 10kHz (I_{AC}): 2.7 A

$$I_{RAC}(105^\circ\text{C}, \geq 5\text{kHz}) = 1.10 \text{ A (from data table)}$$

$$\rightarrow I_{AC}/I_{RAC}(105^\circ\text{C}) = 2.45$$

Operational life: Interpolation between the L_{op} -curves $\rightarrow L_{op} \sim 20 \text{ kh}$ (blue curves)

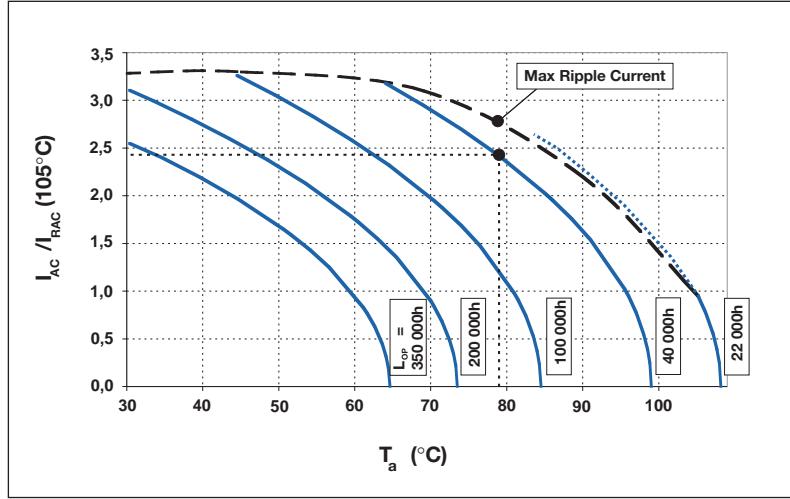

When the capacitor load is at 100Hz,

use $I_{AC}/I_{RAC}(105^\circ\text{C}, 100\text{Hz})$ as input value to the

diagram (see data table). At other frequencies use

$I_{AC}/I_{RAC}(105^\circ\text{C}, \geq 5\text{kHz}) \times 1/\text{Corr} =$

Frequency correction factor, for ripple current (Corr):

FREQUENCY

300 Hz 1 kHz 5 kHz 100 kHz

	300 Hz	1 kHz	5 kHz	100 kHz
Correction factor (Corr) (Typical value)	0.57	0.80	1.00	1.04

RELIABILITY**LEAKAGE CURRENT**

Estimated field failure rate: <2 ppm/year.
The expected failure rate, for this capacitor range, is based on field experience for capacitors with structural similarity. This failure rate is valued during first year of operation.

Expected failure rate thereafter: <1 ppm/y.
(Until end of specified operational life)

Rated leakage current, I_{RL} (μ A)

Rated voltage, U_R (V)

Rated capacitance, C_R (μ F)

For $U_R \leq 160$ V and $C_R \times U_R \leq 1000$
 $I_{RL} = 0.01 \times C_R \times U_R$

For $U_R \leq 160$ V and $C_R \times U_R > 1000$
 $I_{RL} = 0.003 \times C_R \times U_R + 4$

For $U_R > 160$ V
 $I_{RL} = 0.006 \times C_R \times U_R + 4$

CUSTOMER DESIGN

On request PEG124 can be designed in other capacitance values.

PEG 126 150°C

**RoHS
Compliant**

- **150°C**
- **Resistance to vibrations**
- **Low ESR**
- **High ripple capability**

APPLICATION

PEG 126 is a high performance axial electrolytic capacitor. It is designed for automotive applications with high demands on resistance to vibrations and high ambient temperature.

BASIC DESIGN

PEG126 is an electrolytic capacitor with outstanding electrical performance. Polarized, all-welded design, tinned copper wire leads, negative pole connected to the case, plastic insulation. The PEG 126 winding is housed in a cylindrical aluminium can with a high purity aluminium lid and a high quality

rubber gasket. Low ESR is a result of a low resistive electrolyte/paper system and an all-welded design. Thanks to its mechanical robustness the PEG 126 is suitable for use in mobile and aircraft installations, operation up to 150°C.

SPECIFICATION

Standards

IEC 60384-4 Long Life
Grade 40/125/56

Capacitance range

250-4000µF

Capacitance tolerance

-10 to +30%

Rated voltage

25-63 VDC

Temperature range

-40 to +150°C

Operational life time

8500 h at 125°C (Case Ø = 20 mm)

6500 h at 125°C (Case Ø = 16 mm)

Shelf life at

5000 h at 0V+105°C, or

10 years at 0V +40°C

Diameter range

16 – 20 mm

Resistance to vibrations

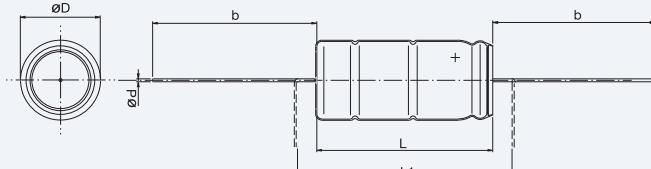

10-2000 Hz, 1.5 mm

displacement amplitude or
max 20 g 3x2 hours

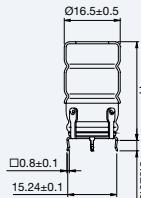

Life test

The capacitors shall be clamped
by their body.

CUSTOMER DESIGN

On request PEG126 can be designed in other capacitance values and case sizes.

INTERMITTENT RIPPLE CURRENT

During intermittent operation, the PEG 126-capacitors allows a significant increase of ripple current compared with specified values (I_{RAC} at continuous operation). Increased ripple current, with up to x1.95, is allowed at max 25% intermittence.

Example 1

Article: PEG126KL427

23A, 5kHz during 30 s, period time 120 s (90 s without ripple)

Ambient temperature: 105°C

- Hot-spot temperature during operation:
Max 135°C (see diagram)
 $L_{OP} = 4700\text{h}$

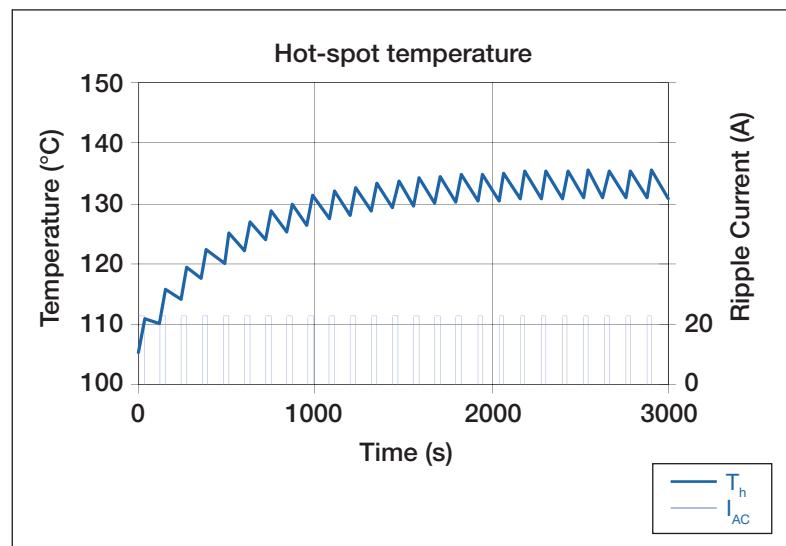

Example 2

Article: PEG126KL427

23A, 5kHz during 140 s, period time 17 minutes (14.7 minutes without ripple, per cycle)

Ambient temperature: 105°C

- Hot-spot temperature during operation:
Max 135°C
 $L_{OP} = 4700\text{h}$

Operational life can be calculated for arbitrary intermittence.
Please contact Customer Support.

OPERATIONAL LIFE AND RIPPLE CURRENT

OPERATIONAL LIFE (L_{op}), at ambient temperature T_a and ripple current I_{AC} .

Diagram valid for Ø20- case size.

Operational life, Ø16- case size: 0.75 x diagram value

Example:

Article: PEG126KJ422EQ (Ø20 x 37 mm)

Ambient temperature (T_a): 85°C

Ripple current, at 10kHz (I_{AC}): 12 A

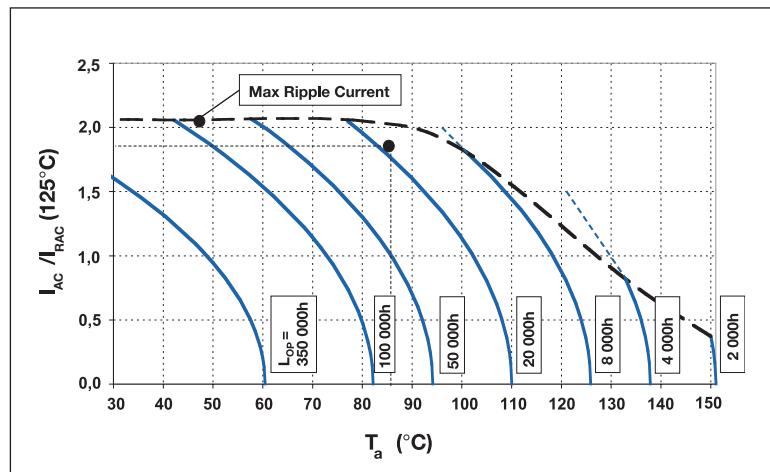

$I_{RAC}(125^\circ\text{C}, \geq 5\text{kHz}) = 6.7\text{A}$ (from data table)

$$\rightarrow I_{AC}/I_{RAC}(125^\circ\text{C}) = 12 / 6.7 = 1.8$$

Operational life: Interpolation between the L_{op} -curves $\rightarrow L_{op} \sim 18\text{kh}$ (blue curves)

When the capacitor load is at 100Hz, use $I_{AC}/I_{RAC}(125^\circ\text{C}, 100\text{Hz})$ as input value to the diagram (see data table). At other frequencies use $I_{AC}/I_{RAC}(125^\circ\text{C}, \geq 5\text{kHz}) \times 1/\text{Corr} =$

Frequency correction factor, for ripple current (Corr):

	FREQUENCY			
	300 Hz	1 kHz	5 kHz	100 kHz
Correction factor (Corr) (Typical value)	0.57	0.80	1.00	1.04

RELIABILITY

LEAKAGE CURRENT

Estimated field failure rate: < 2 ppm/year.
The expected failure rate, for this capacitor range, is based on field experience for capacitors with structural similarity. This failure rate is valued during first year of operation.
Expected failure rate thereafter: < 1 ppm/y.
(Until end of specified operational life)

Rated leakage current, I_{RL} (μA)

Rated voltage, U_R (V)

Rated capacitance, C_R (μF)

$$I_{RL} = 0.003 \times C_R \times U_R + 4$$

RIPPLE CURRENT SPECIFICATION AND OPERATIONAL LIFE

The ripple current specification (see table above) is given at case temperature (T_c) and at ambient temperature (T_a). To be able to operate at specified ripple current at temperature T_c , the capacitor needs to be mounted with low thermal resistance path to application chassis.

Frequency correction factor, for ripple current (Corr), see table to the right:

For operational life time calculation, please see pages 148 to 149.

	FREQUENCY				
	100 Hz	300 Hz	1 kHz	5 kHz	100 kHz
Correction factor (Corr) (Typical value)	0.35	0.57	0.80	1.00	1.04

RELIABILITY

Estimated field failure rate: < 2 ppm/year. The expected failure rate, for this capacitor range, is based on field experience for capacitors with structural similarity. This failure rate is valued during first year of operation. Expected failure rate thereafter: < 1 ppm/y. (Until end of specified operational life)

* Capacitor mounted with low thermal resistance path (heat-sink). Maximum ripple current continuous operation (see below).

** Valid for capacitor supplied with reduced DC voltage, capacitor mounted with low thermal resistance path.

*** Rated ripple current, continuous operation at natural convection (Ø20 case 4000 h, Ø16 case 3000 h).

**** Max ripple current, at natural convection (Ø20 case 2000 h, Ø16 case 1500 h)

RIPPLE CURRENT SPECIFICATION AND OPERATIONAL LIFE

The ripple current specification (see table above) is given at case temperature (T_c) and at ambient temperature (T_a). To be able to operate at specified ripple current at temperature T_c, the capacitor needs to be mounted with low thermal resistance path to application chassis.

Frequency correction factor, for ripple current (Corr), see table to the right:

For operational life time calculation, please see pages 148 to 149.

	FREQUENCY				
	100 Hz	300 Hz	1 kHz	5 kHz	100 kHz
Correction factor (Corr) (Typical value)	0.35	0.57	0.80	1.00	1.04

RELIABILITY

Estimated field failure rate: < 2 ppm/year. The expected failure rate, for this capacitor range, is based on field experience for capacitors with structural similarity. This failure rate is valued during first year of operation. Expected failure rate thereafter: < 1 ppm/y. (Until end of specified operational life)

LEAKAGE CURRENT

Rated leakage current, I_{RL} (μA)
Rated voltage, U_R (V)
Rated capacitance, C_R (μF)
I_{RL} = 0.003 × C_R × U_R + 4

PEG 226 150°C

**RoHS
Compliant**

- Up to 150°C
- Extremely high ripple current
Up to 28A ripple, RMS, Continuous load
- High vibration resistance

APPLICATION

PEG 226 is a new generation of high performance axial electrolytic capacitors, designed for automotive applications with extremely high demands.

BASIC DESIGN

PEG 226 is an electrolytic capacitor with outstanding electrical performance. Polarized, all-welded design, tinned copper wire leads, negative pole connected to the case. The PEG 226 winding is housed in a cylindrical aluminium can with a high purity aluminium lid and a high quality rubber

gasket. Low ESR is a result of a low resistive electrolyte/ paper system and an all-welded design. Thanks to its mechanical robustness the PEG 226 is suitable for use in mobile and in aircraft installations, operation up to 150°C.

SPECIFICATION

Standards

IEC 60384-4 Long Life
Grade 40/125/56

Capacitance range

250 - 4700 µF

Capacitance tolerance

-10 to +30%, -20 to +20%

Rated voltage

25 - 63 VDC

Temperature range

-40 to +150°C

Shelf life at

0V +105°C 5000 h,

+40°C 10 years

Diameter range

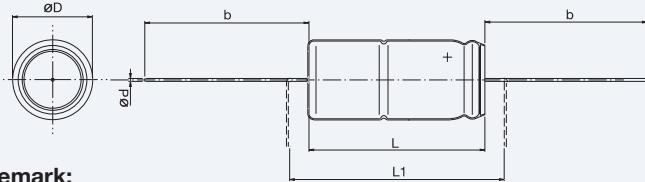

16 - 20 mm

Resistance to vibrations

10 - 2000 Hz, 1.5 mm
displacement amplitude or
max 20 g 3x22 hours

Life test

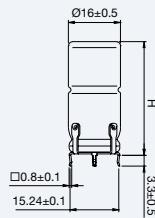

The capacitors must be clamped by the body.
2000 h, 150°C (Ø20 case)
1500 h, 150°C (Ø16 case)

Remark:

Capacitor in standard version
is without insulation. Polyester
insulation on request

Radial version
See page 39

ALS30 Series 85°C

**RoHS
Compliant**

- Compact size
- Long life, 20000 hours at 85°C (Ur, Ir applied)
- High ripple current
- Excellent surge voltage capability
- Optimized designs available on request

APPLICATION

Smoothing, energy storage, or pulse operation in telecommunication demanding power supplies, process control, AC-motor control, traction, welding and measuring.

BASIC DESIGN

The ALS30/31 series of screw terminal capacitors cover a wide range of case sizes and voltage ratings featuring high ripple currents and long life performance. They are ideally suited for industrial and commercial applications demanding high reliability and long life expectancy such as frequency converters, UPS systems and switch mode power supplies.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/85/56,		
Capacitance range	100 – 680000 µF		
Capacitance tolerance	–20 to +20%		
Rated voltage Ur	25–500 VDC		
Surge voltage Us	1.15 x Ur (for Ur ≤ 250 VDC) 1.10 x Ur (for Ur ≥ 350 VDC)	Test Condition: ≤ 30s surge, 1000 cycles @ 85°C	
Surge voltage Uss (Short duration)	Ur Uss 200 350 250 400 350 500 400 520 415 530 450 550 500 600	Test Condition: ≤ 500ms surge, 100 cycles @ 20°C	
Leakage current Il	= 0.006 x Cr x Ur (µA) or 6mA whichever is the smaller. Note, Cr is in µF.	Test Condition: Ur, 5mins., 20°C	
Operational life time +85°C, Ur, Il	Can Diameter 36 11000 hrs 51 18000 hrs 66 19000 hrs 77, 90 20000 hrs	End of Life requirement: $\Delta C/C \leq \pm 10\%$ ESR $\leq 2 \times$ initial ESR value Il \leq initial specified limit

ALS30
Clamp MountingALS31
Stud Mounting

Case Polarity

Due to the presence of electrolyte in the capacitor the aluminium can and stud mounting will essentially be at the same polarity as the negative terminal. We recommend that the stud and can are insulated (see accessories for insulating nuts).

Terminals options

* preferred options in bold

OPERATIONAL DATA

RELIABILITY

Operational Lifetime

Please see separate BHC application notes TD003 for calculating operational life expectancy under customer specific conditions.

The failure rate is derived from our periodic test results. The failure rate (λ_R) is therefore only given at test temperature for life tests. An estimation is also given at 40°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity. Failure rate is frequently quoted in FIT (Failures In Time) where 1 FIT = 1×10^{-9} failures per hour. Failure rates include both catastrophic and parametric failures

T_a	Failure rate per hour
85°C	250 FIT
40°C	12 FIT

MECHANICAL DATA

Mounting position

The capacitor can be mounted in any position so long as the safety vent can operate. It is possible for some electrolyte to be expelled. As this is a conducting liquid, suitable precautions should be instigated by the system designer to avoid secondary short circuits.

The capacitors are designed to be mounted in free air and are not suitable for submersion in liquid.

Vibration

10Hz to 55Hz at 0.75mm or 10g for 3x2hrs duration. Except 220mm long cans 10Hz to 55Hz at 0.35mm or 5g for 3x0.5hrs duration.

Insulating resistance

≥ 100 Mohms at 100V d.c., across insulating sleeve.

Voltage Proof

≥ 2500 V d.c., across insulating sleeve.

Safety vent

A safety vent for over pressure is featured on terminal deck. This is in the form of a rubber plug designed to relieve build up of internal pressure due to over stress or catastrophic failure.

PEH 200 85°C

**RoHS
Compliant**

- High CV-value
- Long Life
- Low ESR and ESL
- Compact size
- Optimized designs available on request

APPLICATION

Typical applications for the new PEH 200 would be found in Uninterruptable Power Supplies (UPS), Ground Power Units (GPU), Welding Equipments and Drives where high current ratings and compact size are important.

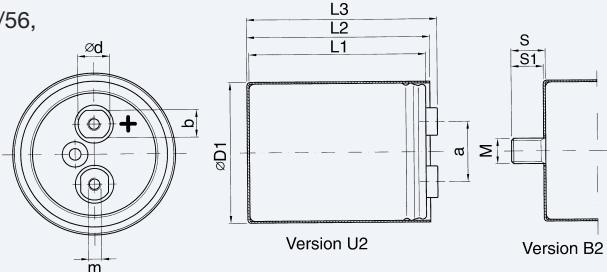

BASIC DESIGN

PEH 200 series has a polarized, all-welded design, heavy duty screw terminals, extended cathode construction, safety vent and plastic insulation. The sealing systems designed for electrolyte leakage free operation and a very low gas-diffusion rate of electrolyte.

Mechanical contact between the winding and the aluminium case allows excellent heat transfer from the winding hot spot to the ambient, which means cooler operation and very high current ratings.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/85/56, DIN 41240
Capacitance range	100–330000 µF
Capacitance tolerance	-20 to +20%
Rated voltage	25–550 VDC
Temperature range	-40 to +85°C
Shelf life	2000 h at 0V +85°C, or 4 years at 0V +40°C
Operational life time	60000 h at +85°C (Case Ø = 90 mm)
Diameter range	35–90 mm

PEH200 - INCREASED SURGE VOLTAGE (1,15XU_R) AND TRANSIENT CAPABILITY

*** Transient measurements

Procedure

The transient voltage has been determined in the following way. Before measurement, the capacitor is charged to the rated voltage at the maximum allowed ambient temperature for 12 hours. The capacitor is then placed in the test equipment and subjected to a transient corresponding to the surge voltage. Note that no operating

voltage is applied over the capacitor. The voltage of the capacitor bank in the test equipment is increased 100 V between each pulse. Pulses are applied until the capacitor breaks. Data from the last pulse the capacitor withstand are evaluated. This procedure is repeated for 25 capacitors.

Data evaluation

The average value, μ , and the standard deviation, σ , of the maximum voltage for the 25 measurements are calculated. The transient voltage U_T , is then taken as: $U_T = \mu - 2\sigma$

OPERATIONAL DATA

Please see operational lifetime section.

RELIABILITY

The failure rate is derived from our periodic test results. The failure rate (λ_R) is therefore only given at test temperature for life tests. An estimation is also given at 60°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity.

T_a	Failure rate per hour
85°C	1×10^{-6}
60°C	1×10^{-7}

Failure rate per hour for catastrophic plus parametric failures.

MECHANICAL DATA

Mounting position

The capacitor can be mounted upright or inclined to a horizontal position.

Clamp fixing

Stamp Hinge
Clips must be ordered separately. See "Accessories".

Stud fixing

Nylon cap nut must be ordered separately.
For the stud fixing insulated version the outer
insulation serves as lock washer.

See "Accessories". Max tightening torque:
M8: 3 Nm M12: 8 Nm. Max chassis thickness
5 mm. Mounting hole: See "Accessories".

Screw terminals

M5 x 10 according to DIN 41.248. Max tightening torque: 2.5 Nm. Must be ordered separately: See "Accessories". Recommended max connector thickness with delivered screw: 4 mm. M6 thread on request.

Insulation can

PEH200 is supplied with a polypropylene insulation can, thickness 0.8 mm. Voltage proof of the insulation sleeve:
≥ 4000 VDC.

PVC shrink sleeve only on request.

ORDERING INFORMATION

For further ordering information please see page 8.

PEH 169 85°C

**RoHS
Compliant**

- High CV-value
- Long Life > 10 years at 50°C
- Low ESR and ESL
- High stability, 10 years shelf life
- Optimized designs available on request

APPLICATION

Smoothing, energy storage, or pulse operation in telecommunication demanding power supplies, process control, AC-motor control, traction, welding and measuring.

BASIC DESIGN

PEH 169 is a Long Life electrolytic capacitor with outstanding reliability and electrical performance. Polarized, all-welded design, heavy duty screw terminals, extended cathode construction, safety vent and plastic insulation. The PEH 169 winding is housed in a cylindrical aluminium can with a rein-forced moulded lid incorporating a safety vent. The sealing system is designed for electrolyte

leakage free operation and a very low gas-diffusion rate of electrolyte. Mechanical contact between the winding and the case allows excellent heat transfer from the winding to the ambient, which means cooler operation. Low ESR is a result of a low resistive paper/electrolyte system, at least two tabs per foil and all-welded design.

TECHNICAL DATA

Please see page 84 for technical data.

ALS34 Series 85°C

**RoHS
Compliant**

- Imperial case sizes and terminals for the North American Market
- Long Life, 20000 hours at 85°C (Ur, Ir applied)
- High ripple current
- Excellent surge voltage capability
- Optimized designs available on request

APPLICATION	BASIC DESIGN																													
<ul style="list-style-type: none"> • Industrial and commercial applications. • Power supplies including switch mode. • UPS systems. • Variable speed drives. • Frequency Inverters. • Welding equipment. • Energy storage in pulse discharge applications. 	The ALS34/35 series of screw terminal capacitors meets the requirements of the North American market. This range offers high CV per unit volume coupled with high ripple currents and long life performance.

SPECIFICATION

Terminal styles A, R

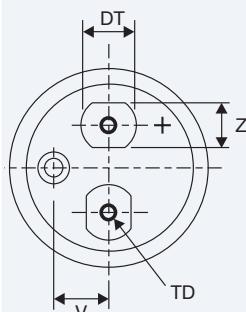

Fig. 1

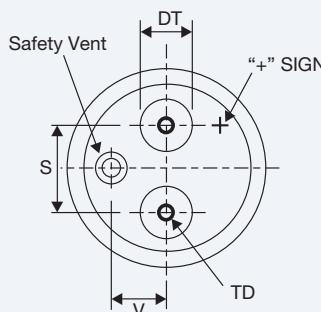

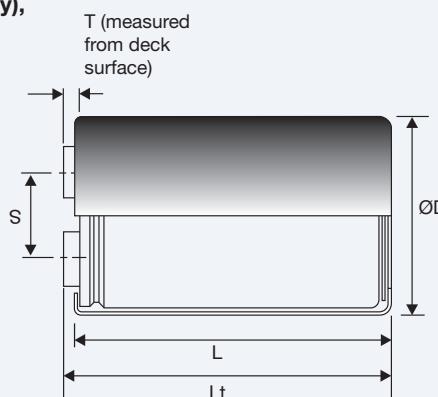

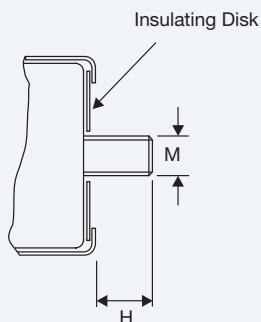

Terminal styles A ($\varnothing 36\text{mm}$ only), C, G, J, M, H & E

Fig. 2

ALS34
Clamp MountingALS35
Stud Mounting

Case Polarity

Due to the presence of electrolyte in the capacitor the aluminium can and stud mounting will essentially be at the same polarity as the negative terminal. We recommend that the stud and can are insulated (see accessories for insulating nuts)..

OPERATIONAL DATA

RELIABILITY

Operational Lifetime

Please see separate BHC application notes TD003 for calculating operational life expectancy under customer specific conditions.

The failure rate is derived from our periodic test results. The failure rate (λ_R) is therefore only given at test temperature for life tests. An estimation is also given at 40°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity. Failure rate is frequently quoted in FIT (Failures In Time) where 1 FIT = 1×10^{-9} failures per hour. Failure rates include both catastrophic and parametric failures

T_a Failure rate per hour

85°C	250 FIT
40°C	12 FIT

MECHANICAL DATA

Mounting position

The capacitor can be mounted in any position so long as the safety vent can operate. It is possible for some electrolyte to be expelled. As this is a conducting liquid, suitable precautions should be instigated by the system designer to avoid secondary short circuits.

The capacitors are designed to be mounted in free air and are not suitable for submersion in liquid.

Vibration

10Hz to 55Hz at 0.75mm or 10g for 3x2hrs duration. Except 220mm long cans 10Hz to 55Hz at 0.35mm or 5g for 3x0.5hrs duration.

Insulating resistance

≥ 100 Mohms at 100V d.c., across insulating sleeve.

Voltage Proof

≥ 2500 V d.c., across insulating sleeve.

Safety vent

A safety vent for over pressure is featured on terminal deck. This is in the form of a rubber plug designed to relieve build up of internal pressure due to over stress or catastrophic failure.

ALS32 Series 85°C

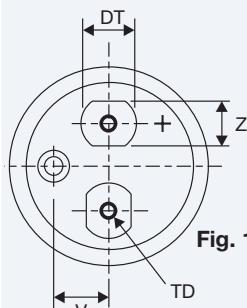

**RoHS
Compliant**

- Case sizes and terminals for the Asian Market
- Long Life, 20000 hours at 85°C (Ur, Ir applied)
- High ripple current
- Excellent surge voltage capability
- Optimized designs available on request

APPLICATION	BASIC DESIGN																	
<ul style="list-style-type: none"> Industrial and commercial applications. Power supplies including switch mode. UPS systems. Variable speed drives. Frequency Inverters. Welding equipment. Energy storage in pulse discharge applications. 	The ALS32/33 series of screw terminal capacitors meets the requirements of the Asian market. This range offers high CV per unit volume coupled with high ripple currents and long life performance.

SPECIFICATION

Terminal style A

Terminal styles A (ø35mm), C

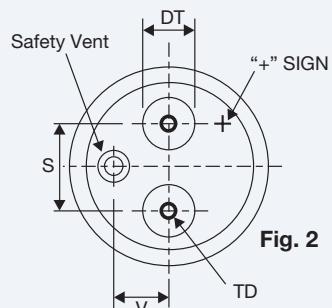

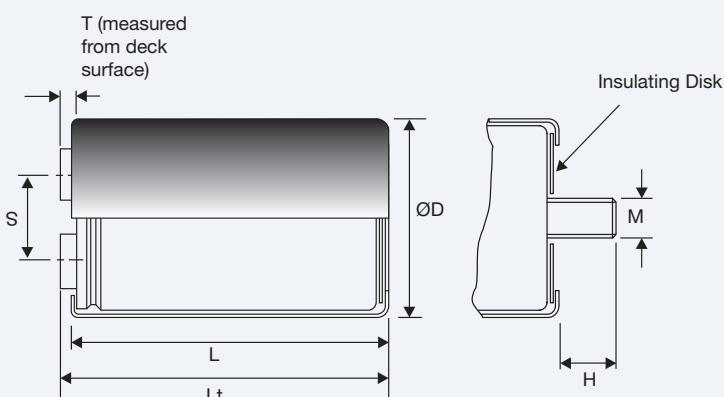

Fig. 1

Fig. 2

ALS32
Clamp MountingALS33
Stud Mounting

Case Polarity

Due to the presence of electrolyte in the capacitor the aluminium can and stud mounting will essentially be at the same polarity as the negative terminal. We recommend that the stud and can are insulated (see accessories for insulating nuts).

Terminations

Aluminium inserts M5 threads as standard, max. torque 2NM. M6 threaded inserts have a max. torque 4NM. Max. torque for stud mounting M8:4NM and M12:8NM.

OPERATIONAL DATA

RELIABILITY

Operational Lifetime

Please see separate BHC application notes TD003 for calculating operational life expectancy under customer specific conditions.

The failure rate is derived from our periodic test results. The failure rate (λ_R) is therefore only given at test temperature for life tests. An estimation is also given at 40°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity. Failure rate is frequently quoted in FIT (Failures In Time) where 1 FIT = 1×10^9 failures per hour. Failure rates include both catastrophic and parametric failures

T_a Failure rate per hour

85°C	250 FIT
40°C	12 FIT

MECHANICAL DATA

Mounting position

The capacitor can be mounted in any position so long as the safety vent can operate. It is possible for some electrolyte to be expelled. As this is a conducting liquid, suitable precautions should be instigated by the system designer to avoid secondary short circuits.

The capacitors are designed to be mounted in free air and are not suitable for submersion in liquid.

Vibration

10Hz to 55Hz at 0.75mm or 10g for 3x2hrs duration. Except 220mm long cans 10Hz to 55Hz at 0.35mm or 5g for 3x0.5hrs duration.

Insulating resistance

≥ 100 Mohms at 100V d.c., across insulating sleeve.

Voltage Proof

≥ 2500 V d.c., across insulating sleeve.

Safety vent

A safety vent for over pressure is featured on terminal deck. This is in the form of a rubber plug designed to relieve build up of internal pressure due to over stress or catastrophic failure.

ALS40 Series 105°C

**RoHS
Compliant**

- Compact Size
- Long Life, 9000 hours at 105°C (Ur, Ir applied)
- High ripple current
- Excellent surge voltage capability
- Optimized designs available on request

APPLICATION	BASIC DESIGN																	
Smoothing, energy storage, or pulse operation in telecommunication demanding power supplies, process control, AC-motor control, traction, welding and measuring.	The ALS40/41 series of screw terminal capacitors feature the same high ripple currents and long life characteristics as the ALS30/31 series but can operate at higher temperatures. They are similarly suited for high reliability and long life applications such as frequency converters, UPS systems and switch mode power supplies, but the extended temperature range allows increased ripple currents at lower temperatures.																	
SPECIFICATION																		
Standards	IEC 60384-4 Long Life Grade 40/85/56,																	
Capacitance range	150 – 680000 µF																	
Capacitance tolerance	-20 to +20%																	
Rated voltage Ur	25–450 VDC																	
Surge voltage Us	1.15 x Ur (for Ur ≤ 250 VDC) 1.10 x Ur (for Ur ≥ 350 VDC)	Test Condition: ≤ 30s surge, 1000 cycles @ 105°C

OPERATIONAL DATA

RELIABILITY

Operational Lifetime

Please see separate BHC application notes TD003 for calculating operational life expectancy under customer specific conditions.

The failure rate is derived from our periodic test results. The failure rate (λ_R) is therefore only given at test temperature for life tests. An estimation is also given at 40°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity. Failure rate is frequently quoted in FIT (Failures In Time) where 1 FIT = 1×10^9 failures per hour. Failure rates include both catastrophic and parametric failures

T_a Failure rate per hour

85°C	220 FIT
40°C	10 FIT

MECHANICAL DATA

Mounting position

The capacitor can be mounted in any position so long as the safety vent can operate. It is possible for some electrolyte to be expelled. As this is a conducting liquid, suitable precautions should be instigated by the system designer to avoid secondary short circuits.

The capacitors are designed to be mounted in free air and are not suitable for submersion in liquid.

Vibration

10Hz to 55Hz at 0.75mm or 10g for 3x2hrs duration. Except 220mm long cans 10Hz to 55Hz at 0.35mm or 5g for 3x0.5hrs duration.

Insulating resistance

≥ 100 Mohms at 100V d.c., across insulating sleeve.

Voltage Proof

≥ 2500 V d.c., across insulating sleeve.

Safety vent

A safety vent for over pressure is featured on terminal deck. This is in the form of a rubber plug designed to relieve build up of internal pressure due to over stress or catastrophic failure.

PEH 169 105°C

**RoHS
Compliant**

- **High performance**
- **Long Life, > 10 years at 50°C**
- **Low ESR and ESL**
- **High stability, 10 years shelf life**
- **Optimized designs available on request**

APPLICATION

Smoothing, energy storage, or pulse operation in telecommunication demanding power supplies, process control, AC-motor control, traction, welding and measuring.

BASIC DESIGN

PEH 169 is a Long Life electrolytic capacitor with outstanding reliability and electrical performance. Polarized, all-welded design, heavy duty screw terminals, extended cathode construction, safety vent and plastic insulation. The PEH 169 winding is housed in a cylindrical aluminium can with a reinforced moulded lid incorporating a safety vent. The sealing system is designed

for electrolyte leakage free operation and a very low gas-diffusion rate of electrolyte. Mechanical contact between the winding and the case allows excellent heat transfer from the winding to the ambient, which means cooler operation. Low ESR is a result of a low resistive paper/electrolyte system, at least two tabs per foil and all-welded design.

TECHNICAL DATA PEH 169 (85°C AND 105°C)

The capacitance vs ambient temperature
 (T_a) at $f = 100$ Hz

ESR as a function of ambient temperature
 (T_a) at $f = 100$ kHz. $k = R_{ESR}(T_a)/R_{ESR}(20^\circ C)$

LEAKAGE CURRENT

Rated leakage current, I_{RL} (μA).

Rated voltage, U_R (V).

Rated capacitance, C_R (μF). $I_{RL} = 0.003 \times C_R \times U_R + 4$

 R_{th} – short form table versus chassis area and air speed

D x L	Case code	STUD MOUNTED				CLIP MOUNTED	
		$R_{th,ss} = 3^\circ C/W$ (0.5 m/s)	$R_{th,ss} = 2^\circ C/W$ (0.5 m/s)	$R_{th,ss} = 3^\circ C/W$ (2.0 m/s)	$R_{th,ss} = 2^\circ C/W$ (2.0 m/s)	(0.5 m/s)	(2.0 m/s)

OPERATIONAL DATA

RELIABILITY

Please see operational lifetime section.

The failure rate is derived from our periodic test results. The failure rate (I_R) is therefore only given at test temperature for life tests. An estimation is also given at 60°C.

The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity.

T_a	Failure rate per hour
85°C	1×10^{-6}
60°C	1×10^{-7}

Failure rate per hour for catastrophic plus parametric failures.

MECHANICAL DATA

Mounting position

The capacitor can be mounted upright or inclined to a horizontal position.

Clamp fixing

Clips must be ordered separately. See "Accessories".

Stud fixing

Nylon cap nut must be ordered separately.

For the stud fixing insulated version the outer insulation serves as lock washer. See "Accessories". Max tightening torque: M8: 3 Nm M12: 8 Nm. Max chassis thickness 5 mm. Mounting hole: See "Accessories".

Screw terminals

M5 x 10 according to DIN 41.248. Max tightening torque: 2.5 Nm. Must be ordered separately: See "Accessories".

Recommended max connector thickness with delivered screw: 4 mm. M6 thread on request.

Insulation can

PEH169 is supplied with a polypropylene insulation can, thickness 0.8 mm. Voltage proof of the insulation sleeve: ≥ 4000 VDC.

PVC shrink sleeve only on request.

ORDERING INFORMATION

Pos 1–20

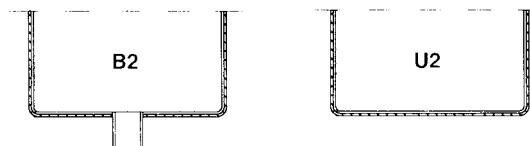

P	E	H	1	6	9	K	U	5	6	8	0	Q	B	2					
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20

Capacitance tolerances:

Pos. 13: Q = -10 to +30%

M: -20 to +20%

Pos. 14-15: B2 = with bottom stud
U2 = without bottom stud

ALC10 Series 85°C

**RoHS
Compliant**

- Compact size
- Long Life, 18000 hours at 85°C (Ur, Ir applied)
- High ripple current
- Excellent surge voltage capability
- Optimized designs available on request

APPLICATION

BASIC DESIGN

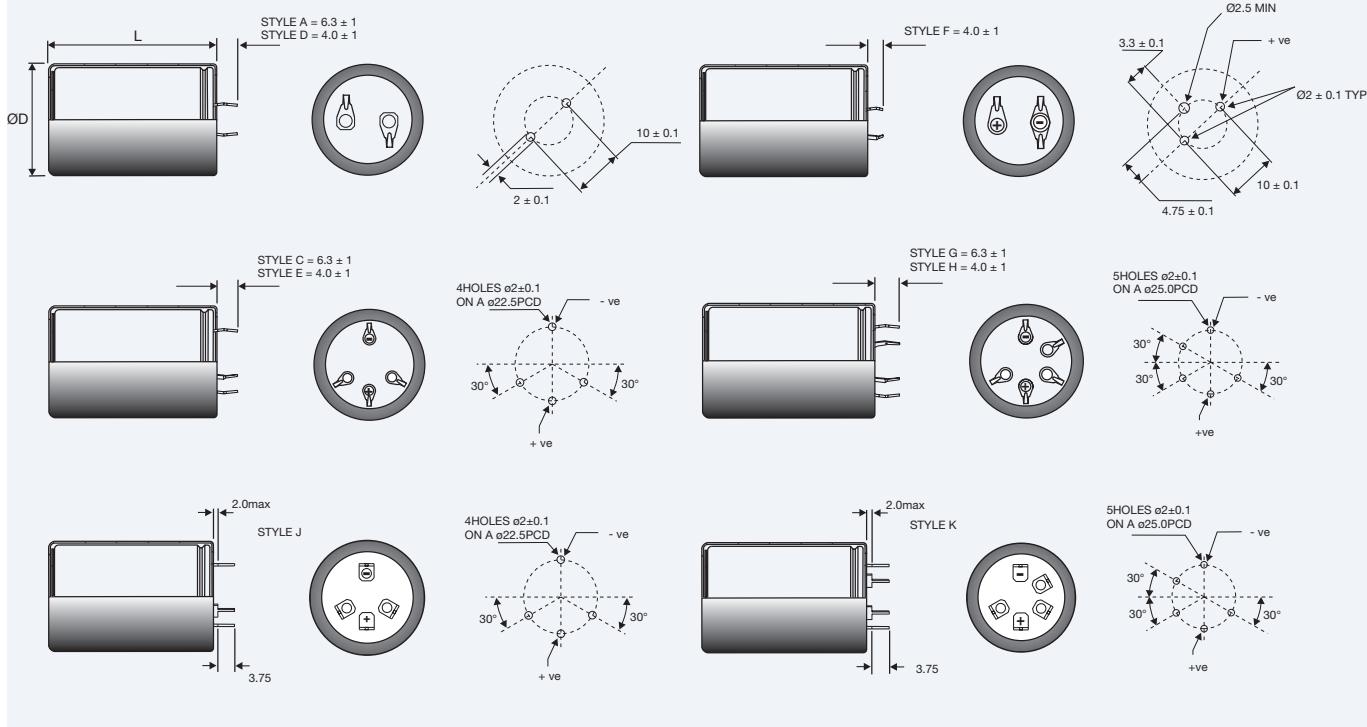

They are ideally suited for industrial and commercial applications demanding high reliability and long life expectancy such as frequency converters, UPS systems and switch mode power supplies.

The ALC10 series of snap-in capacitors cover a wide range of case sizes and voltage ratings featuring high ripple current and surge voltage capability and very long life performance.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/85/56,				
Capacitance range	56 – 82000 µF				
Capacitance tolerance	–20 to +20%				
Rated voltage Ur	40–450 VDC				
Surge voltage Us	1.15 x Ur (for Ur ≤ 250 VDC) 1.10 x Ur (for Ur ≥ 350 VDC)	Test Condition: ≤ 30s surge, 1000 cycles @ 85°C			
Surge voltage Uss (Short duration)	Ur Uss 200 350 250 400 350 500 400 520 415 530 450 550 500 600	Test Condition: ≤ 500ms surge, 100 cycles @ 20°C			
Leakage current IL	= 0.006 x Cr x Ur (µA) or 6mA whichever is the smaller. Note, Cr is in µF.	Test Condition: Ur, 5mins., 20°C			
Operational life time +85°C, Ur, Ir	Can Diameter 25 10000 hrs 30 13000 hrs 35 15000 hrs 40, 45, 50 18000 hrs	End of Life requirement: ΔC/C ≤ ±10% ESR ≤ 2 x initial ESR value IL ≤ initial specified limit			
+85°C, Ur	Can Diameter 25 16000 hrs 30 21000 hrs 35 24000 hrs 40, 45, 50 29000 hrs				
Shelf Life	2000 hrs at 0V +85°C, or 30000 hrs at 0V +40°C				
Temperature range	–40 to +85°C (Operating) -55°C to +85°C (Storage)				

SPECIFICATION

**Mounting**

These capacitors are designed to be mounted by their terminations alone, and may be used in any position. Dummy pins must be isolated on 4 and 5 pin styles.

OPERATIONAL DATA	RELIABILITY	
<p>Operational Lifetime Please see separate BHC application notes TD003 for calculating operational life expectancy under customer specific conditions.</p>	<p>The failure rate is derived from our periodic test results. The failure rate (λ_R) is therefore only given at test temperature for life tests. An estimation is also given at 40°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity. Failure rate is frequently quoted in FIT (Failures In Time) where 1 FIT = 1×10^{-9} failures per hour.</p>	

MECHANICAL DATA		
Mounting position The capacitor can be mounted upright or inclined to a horizontal position.	Insulating resistance ≥ 100 Mohms at 100V d.c., across insulating sleeve.	Safety vent A safety vent for over pressure is featured on either the base (opposing end to the terminals) or on the side of the can. This is in the form of a grooved section on the surface of the can which is a weakened area and is designed to relieve build up of internal pressure due to over stress or catastrophic failure.
Vibration 10Hz to 500Hz at 0.75mm or 10g for 3x2hrs duration. 10Hz to 55Hz at 0.35mm or 5g for 3x0.5hrs duration (45/50mm diameter cans).	Voltage Proof ≥ 2500V d.c., across insulating sleeve.	

PEH 506 85°C

**RoHS
Compliant**

- Snap-In
- Long Life Grade
- PCB mounting
- Low ERS and ESL
- High ripple current

APPLICATION

Typical applications for PEH 506 would be SMPS, drives, welding equipment, UPS and other power electronic applications where high current ratings and compact size are important.

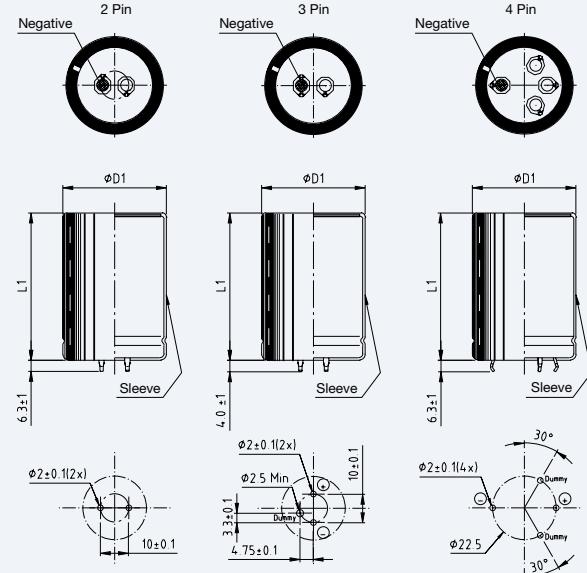

BASIC DESIGN

PEH 506 is a Long Life electrolytic capacitor designed to offer high ripple current capability and low mounting cost. The low ESR is a result of very low resistive paper/electrolyte system.

The low ESR together with the TDC thermal concept gives the PEH 506 a high ripple current capability.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/85/56, in accordance with CECC 30 301-809
Capacitance range	68–27000 μF
Capacitance tolerance	-20 to +20%
Rated voltage	35–450 VDC
Temperature range	-40 to +85°C
Leakage current, I_{RL} (μA)	0.003 (μA) $\times C_R$ (μF) $\times U_R$ (V)
Operational life time +85°C, U_R	6000 hours
Shelf life	4 years at 0 Volt and +40°C
Diameter range	22–35 mm
Pin configuration Diameter range	22-35 mm: 2-3 pins

ALC12 Series 85°C

RoHS
Compliant

- Compact Size
- 2000 hours at 85 °C (Ur, Ir applied)
- Excellent surge voltage capability
- Optimized designs available on request

APPLICATION

Designed for applications where high reliability and compact sizes are important such as switch mode power supplies and frequency converters.

BASIC DESIGN

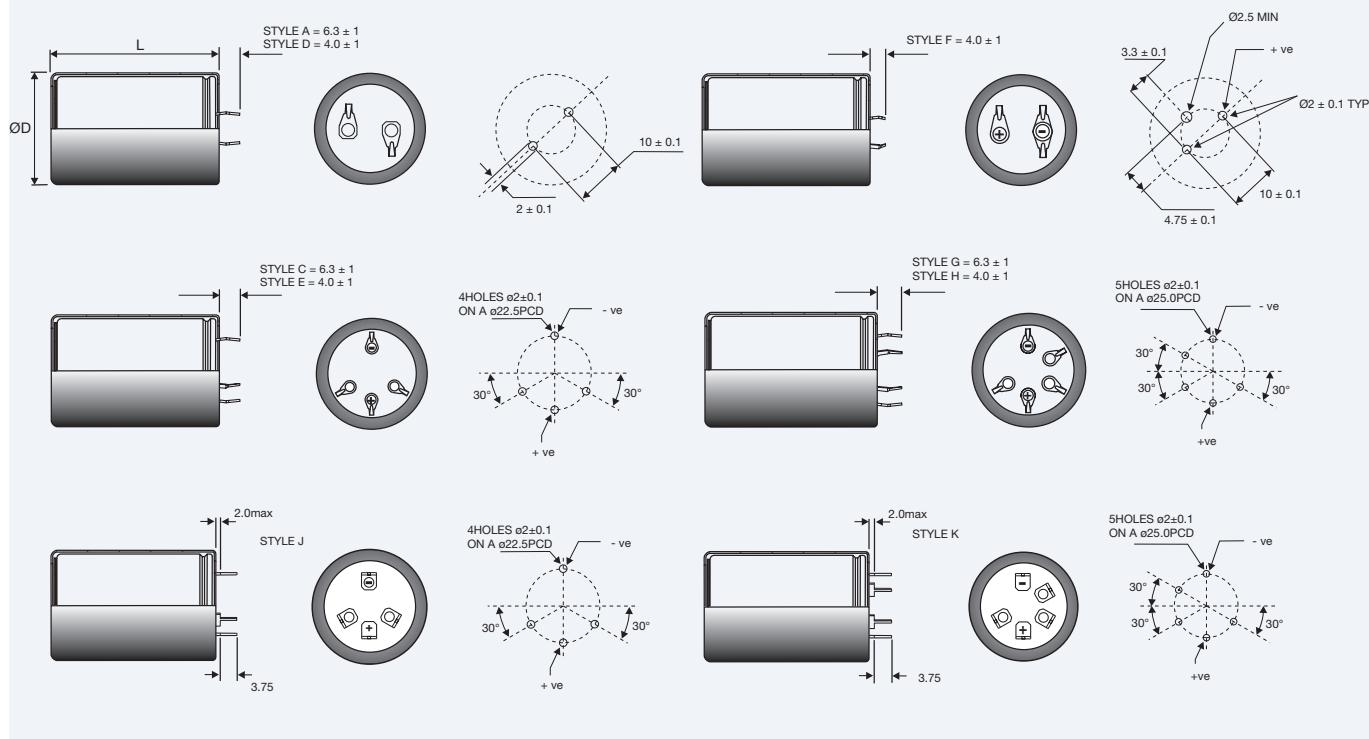

The ALC12 (85°C) is a high CV snap-in version of the ALC10 range. Both series are designed for applications where high

reliability and compact sizes are important such as switch mode power supplies and frequency converters.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/85/56,																	
Capacitance range	150 – 8200 µF																	
Capacitance tolerance	–20 to +20%																	
Rated voltage Ur	200 - 450 VDC																	
Surge voltage Us	1.15 x Ur (for Ur ≤ 250 VDC) 1.10 x Ur (for Ur ≥ 350 VDC)	Test Condition: ≤ 30s surge, 1000 cycles @ 85°C																
Surge voltage Uss (Short duration)	<table> <thead> <tr> <th>Ur</th> <th>Uss</th> </tr> </thead> <tbody> <tr> <td>200</td> <td>350</td> </tr> <tr> <td>250</td> <td>400</td> </tr> <tr> <td>350</td> <td>500</td> </tr> <tr> <td>400</td> <td>520</td> </tr> <tr> <td>415</td> <td>530</td> </tr> <tr> <td>450</td> <td>550</td> </tr> <tr> <td>500</td> <td>600</td> </tr> </tbody> </table>	Ur	Uss	200	350	250	400	350	500	400	520	415	530	450	550	500	600	Test Condition: ≤ 500ms surge, 100 cycles @ 20°C
Ur	Uss																	
200	350																	
250	400																	
350	500																	
400	520																	
415	530																	
450	550																	
500	600																	
Leakage current Il	= 0.006 x Cr x Ur (µA) or 6mA whichever is the smaller. Note, Cr is in µF.	Test Condition: Ur, 5mins., 20°C																
Operational life time +85°C, Ur, Ir	Can Diameter 30, 35, 40, 45, 50 2000 hrs	End of Life requirement: $\Delta C/C \leq \pm 10\%$ $ESR \leq 2 \times$ initial ESR value $I_L \leq$ initial specified limit																
+85°C, Ur	Can Diameter 30, 35, 40, 45, 50 9000 hrs																	
Shelf Life	2000 hrs at 0V +85°C, or 30000 hrs at 0V +40°C																	
Temperature range	–40 to +85°C (Operating) –55°C to +85°C (Storage)																	

SPECIFICATION

**Mounting**

These capacitors are designed to be mounted by their terminations alone, and may be used in any position. Dummy pins must be isolated on 4 and 5 pin styles.

OPERATIONAL DATA	RELIABILITY						
<p>Operational Lifetime Please see separate BHC application notes TD003 for calculating operational life expectancy under customer specific conditions.</p>	<p>The failure rate is derived from our periodic test results. The failure rate (λ_R) is therefore only given at test temperature for life tests. An estimation is also given at 40°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity. Failure rate is frequently quoted in FIT (Failures In Time) where 1 FIT = 1×10^{-9} failures per hour.</p> <table> <tr> <td>T_a</td> <td>Failure rate per hour</td> </tr> <tr> <td>85°C</td> <td>250 FIT</td> </tr> <tr> <td>40°C</td> <td>12 FIT</td> </tr> </table> <p>Failure rate per hour for catastrophic plus parametric failures.</p>	T_a	Failure rate per hour	85°C	250 FIT	40°C	12 FIT
T_a	Failure rate per hour						
85°C	250 FIT						
40°C	12 FIT						

MECHANICAL DATA	
Mounting position	The capacitor can be mounted upright or inclined to a horizontal position.
Vibration	10Hz to 500Hz at 0.75mm or 10g for 3x2hrs duration. 10Hz to 55Hz at 0.35mm or 5g for 3x0.5hrs duration (45/50mm diameter cans).
Insulating resistance	≥ 100 Mohms at 100V d.c., across insulating sleeve.
Voltage Proof	≥ 2500 V d.c., across insulating sleeve.
Safety vent	A safety vent for over pressure is featured on either the base (opposing end to the terminals) or on the side of the can. This
	is in the form of a grooved section on the surface of the can which is a weakened area and is designed to relieve build up of internal pressure due to over stress or catastrophic failure.

ALC40 Series 105°C

**RoHS
Compliant**

- Compact Size
- Long life, 9000 hours at 105 °C (Ur, Ir applied)
- High ripple current
- Excellent surge voltage capability
- Optimized designs available on request

APPLICATION

BASIC DESIGN

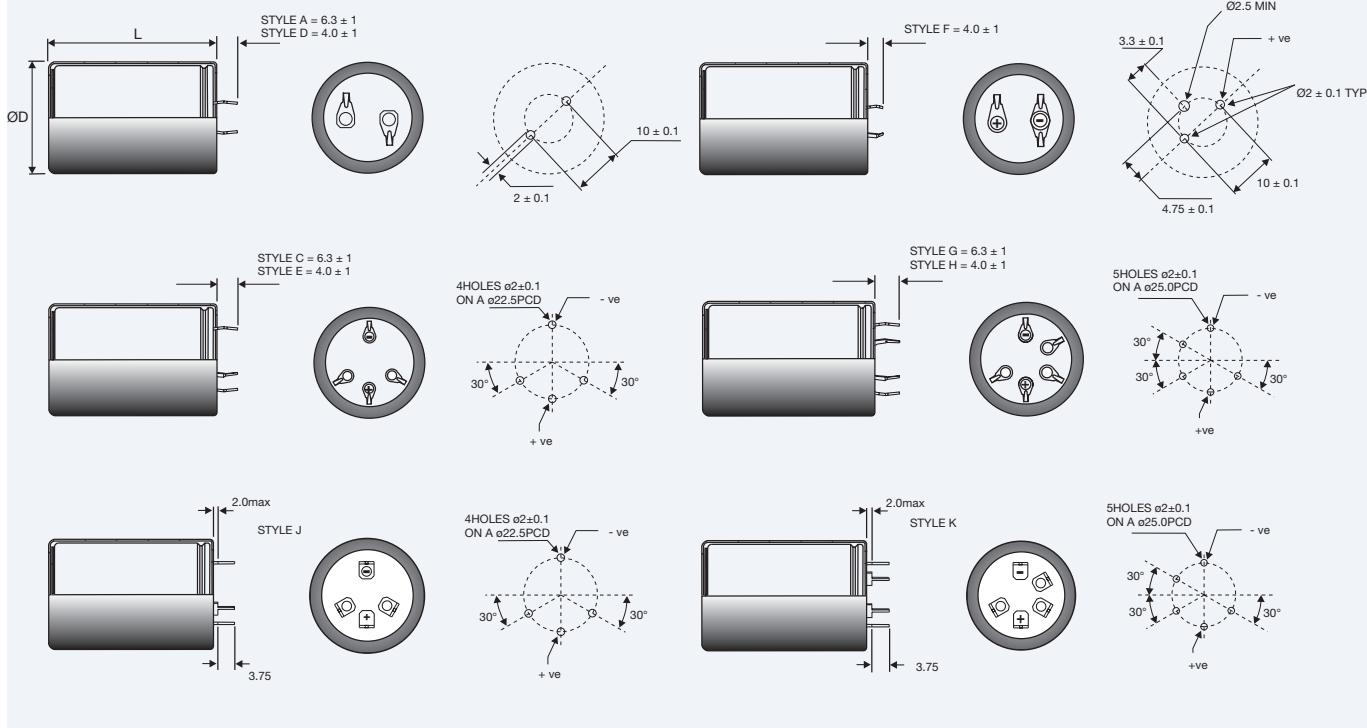

Suited for high reliability and long life applications such as frequency converters, UPS systems and switch mode power supplies, but the extended temperature range allows increased ripple currents at lower temperatures.

The ALC40 series of snap-in capacitors feature the same high ripple currents and long life characteristics as the ALC10 series but can operate at higher temperatures.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/105/56,		
Capacitance range	47 – 120000 µF		
Capacitance tolerance	–20 to +20%		
Rated voltage Ur	25 – 450 VDC		
Surge voltage Us	1.15 x Ur (for Ur ≤ 250 VDC) 1.10 x Ur (for Ur ≥ 350 VDC)	Test Condition: ≤ 30s surge, 1000 cycles @ 105°C	
Surge voltage Uss (Short duration)	Ur Uss 200 350 250 400 350 500 400 520 415 530 450 550 500 600	Test Condition: ≤ 500ms surge, 100 cycles @ 20°C	
Leakage current IL	= 0.003 x Cr x Ur (µA) or 6mA whichever is the smaller. Note, Cr is in µF.	Test Condition: Ur, 5mins., 20°C	
Operational life time +105°C, Ur, Ir	Can Diameter 25 6000 hrs 30 7000 hrs 35 8000 hrs 40, 45, 50 9000 hrs	End of Life requirement: ΔC/C ≤ ±10% ESR ≤ 2 x initial ESR value IL ≤ initial specified limit	
+105°C, Ur	Can Diameter 25 10000 hrs 30 11000 hrs 35 13000 hrs 40, 45, 50 14000 hrs		
Shelf Life	2000 hrs at 0V +85°C, or 30000 hrs at 0V +40°C		
Temperature range	–40 to +105°C (Operating) -55°C to +105°C (Storage)

OPERATIONAL DATA

RELIABILITY

Operational Lifetime

Please see separate BHC application notes TD003 for calculating operational life expectancy under customer specific conditions.

The failure rate is derived from our periodic test results. The failure rate (λ_p) is therefore only given at test temperature for life tests. An estimation is also given at 40°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity. Failure rate is frequently quoted in FIT (Failures In Time) where 1 FIT = 1×10^{-9} failures per hour.

T_a Failure rate per hour

85°C 220 FIT
40°C 10 FIT

Failure rate per hour for catastrophic plus parametric failures.

MECHANICAL DATA

Mounting position

The capacitor can be mounted upright or inclined to a horizontal position.

Insulating resistance

≥ 100 Mohms at 100V d.c., across insulating sleeve.

Safety vent

A safety vent for over pressure is featured on either the base (opposing end to the terminals) or on the side of the can. This is in the form of a grooved section on the surface of the can which is a weakened area and is designed to relieve build up of internal pressure due to over stress or catastrophic failure.

Vibration

10Hz to 500Hz at 0.75mm or 10g for 3x2hrs duration. 10Hz to 55Hz at 0.35mm or 5g for 3x0.5hrs duration (45/50mm diameter cans).

Voltage Proof

≥ 2500 V d.c., across insulating sleeve.

PEH 532 105°C

**RoHS
Compliant**

- Snap-In
- Long Life Grade
- PCB Mounting
- Low ESR and ESL
- High ripple current

APPLICATION

Typical applications for PEH 532 would be SMPS, drives, welding equipment, UPS and other power electronic applications where high current ratings and compact size are important.

BASIC DESIGN

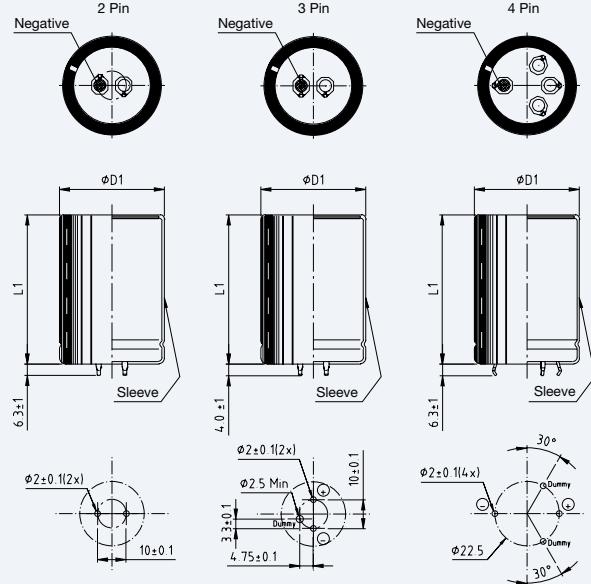

The low ESR together with the TDC thermal concept gives the PEH 532 a high ripple current capability.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/105/56, in accordance with CECC 30 301-809
Capacitance range	68–27000 µF
Capacitance tolerance	–20 to +20%
Rated voltage	35–450 VDC
Temperature range	–40 to +105°C
Leakage current, I_{RL} (µA)	$0.003 (\mu\text{A}) \times C_R (\mu\text{F}) \times U_R (\text{V})$
Operational life time	2000 hours at +105°C
Shelf life	4 years at 0 Volt and +40°C
Diameter range	22–35 mm

Pin configuration

Diameter range 22–35 mm: 2–3 pins

MECHANICAL DATA

The capacitor may be mounted in any position. The PEH 532 is supplied with PVC insulation sleeve, thickness 0.3 mm. Voltage proof of the insulation sleeve = 2.5 kVDC (1 min). The minus pole is marked on the case surface.

ORDERING INFORMATION

(R_{thca} = Thermal resistance between case and ambient)

PEH 534 105°C

**RoHS
Compliant**

- Snap-In
- Long Life Grade
- PCB Mounting
- Low ESR and ESL
- High ripple current

APPLICATION

Typical applications for PEH 534 would be SMPS, drives, welding equipment, UPS and other power electronic applications where high current ratings and compact size are important.

BASIC DESIGN

PEH 534 is a Long Life electrolytic capacitor designed to offer high ripple current capability and low mounting cost. The low ESR is a result of very low resistive paper/electrolyte system.

The low ESR together with the TDC thermal concept gives the PEH 534 a high ripple current capability.

SPECIFICATION

Standards

IEC 60384-4 Long Life Grade 40/105/56, in accordance with CECC 30 301-809

Capacitance range

150–22000 µF

Capacitance tolerance

-20 to +20%

Rated voltage

35–450 VDC

Temperature range

-40 to +105°C

Leakage current, I_{RL} (µA)

0.003 (µA) $\times C_R$ (µF) $\times U_R$ (V)

Operational life time

4000 hours at +105°C

Shelf life

4 years at 0 Volt and +40°C

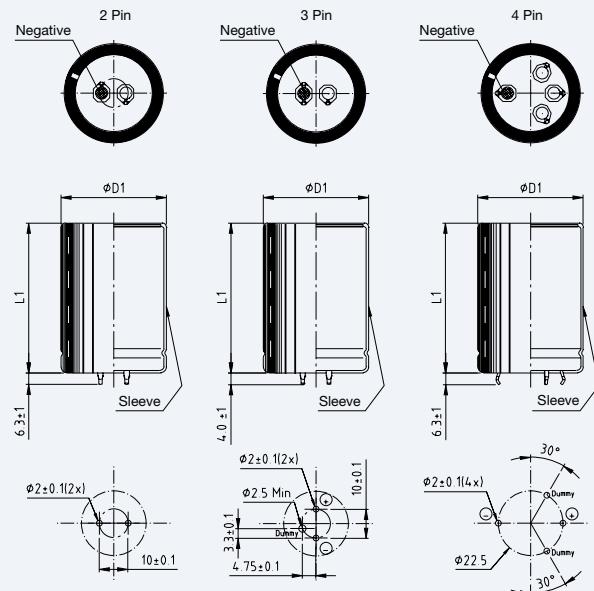

Diameter range

25–35 mm

Pin configuration

Diameter range

25–35 mm: 2-3 pins

MECHANICAL DATA

The capacitor may be mounted in any position. The PEH 534 is supplied with PVC insulation sleeve, thickness 0.3 mm. Voltage proof of the insulation sleeve = 2.5 kVDC (1 min). The minus pole is marked on the case surface.

ORDERING INFORMATION

For further ordering information please see page 8.

(R_{thca} = Thermal resistance between case and ambient)

PEH 536 105°C

**RoHS
Compliant**

- Snap-In
- Ultra Long Life Grade
- PCB Mounting
- Low ESR and ESL
- High ripple current

APPLICATION

Typical applications for PEH 536 would be SMPS, drives, welding equipment, UPS and other power electronic applications where high current ratings and compact size are important.

BASIC DESIGN

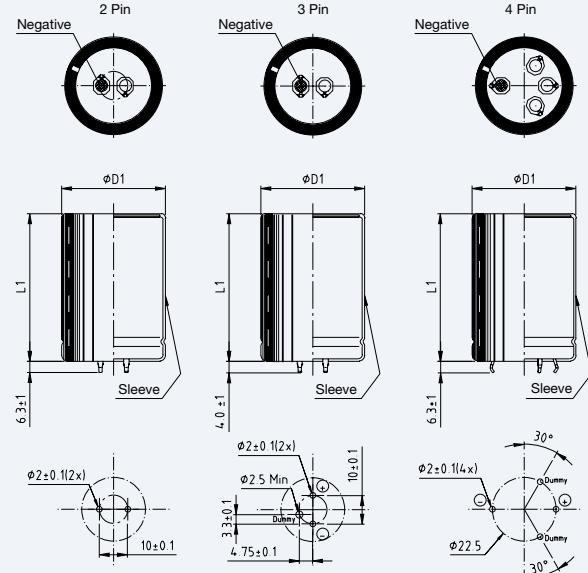

The low ESR together with the TDC thermal concept gives the PEH 536 a high ripple current capability.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/105/56, in accordance with CECC 30 301-809
Capacitance range	47-18000 µF
Capacitance tolerance	-20 to +20%
Rated voltage	35-450 VDC
Temperature range	-40 to +105°C
Leakage current, I_{RL} (µA)	$0.003 (\mu\text{A}) \times C_R (\mu\text{F}) \times U_R (\text{V})$
Operational life time	6000 hours at +105°C
Shelf life	4 years at 0 Volt and +40°C
Diameter range	22-40 mm

Pin configuration

Diameter range
22-35 mm: 2-3 pins
40 mm: 4 pins

MECHANICAL DATA

The capacitor may be mounted in any position. The PEH 536 is supplied with PVC insulation sleeve, thickness 0.3 mm. Voltage proof of the insulation sleeve = 2.5 kVDC (1 min). The minus pole is marked on the case surface.

ORDERING INFORMATION

ALC42 Series 105°C

RoHS
Compliant

- Compact Size
- 2000 hours at 105 °C (U_R , I_R applied)
- Excellent surge voltage capability
- Optimized designs available on request

APPLICATION

BASIC DESIGN

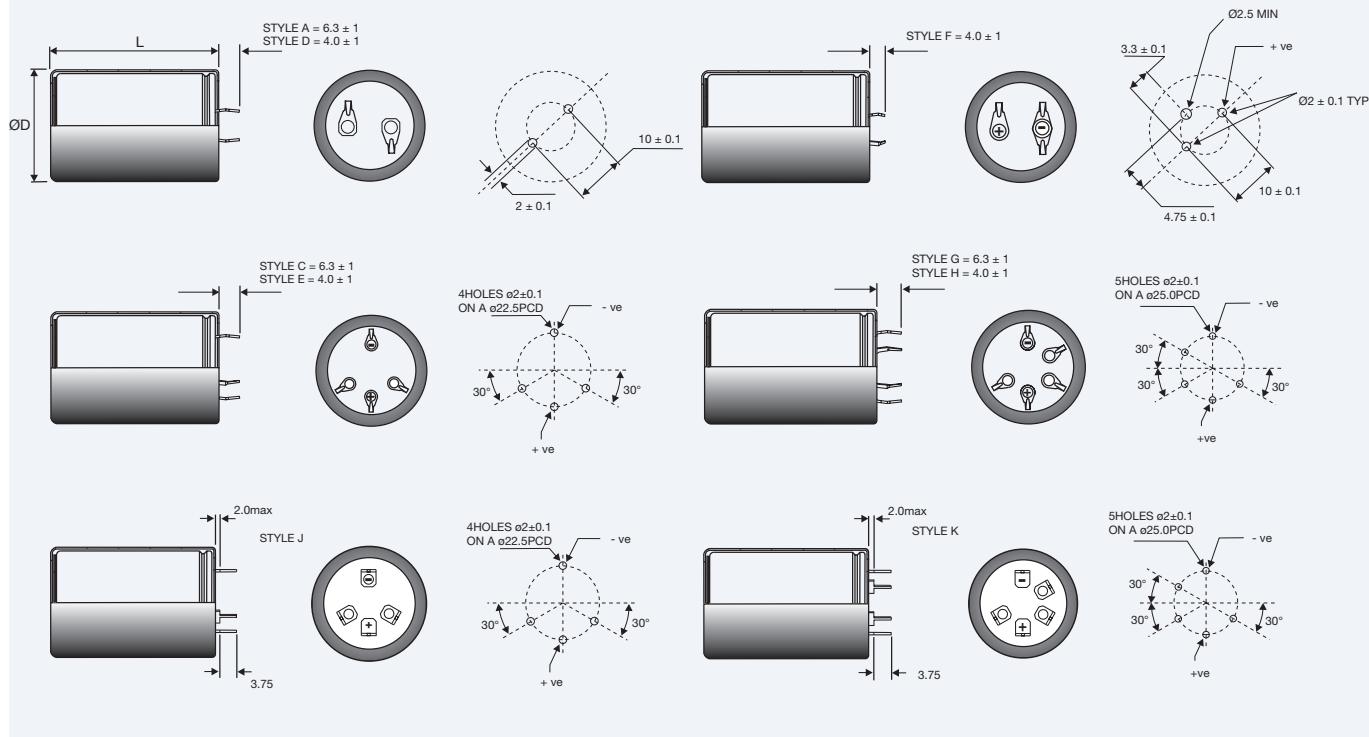

Designed for applications where high reliability and compact sizes are important such as switch mode power supplies and frequency converters.

The ALC42 (105°C) is a high CV snap-in version of the ALC40 range.

SPECIFICATION

Standards	IEC 60384-4 Long Life Grade 40/105/56,	
Capacitance range	120 – 6800 µF	
Capacitance tolerance	–20 to +20%	
Rated voltage U_R	200 - 450 VDC	
Surge voltage U_s	1.15 x U_R (for $U_R \leq 250$ VDC) 1.10 x U_R (for $U_R \geq 350$ VDC)	Test Condition: ≤ 30 s surge, 1000 cycles @ 105°C
Surge voltage U_{ss} (Short duration)	U_R U_{ss} 200 350 250 400 350 500 400 520 415 530 450 550 500 600	Test Condition: ≤ 500 ms surge, 100 cycles @ 20°C
Leakage current I_L	= 0.003 x C_R x U_R (µA) or 6mA whichever is the smaller. Note, C_R is in µF.	Test Condition: U_R , 5mins., 20°C
Operational life time +105°C, U_R , I_R	Can Diameter 30, 35, 40, 45, 50 2000 hrs	End of Life requirement: $\Delta C/C \leq \pm 10\%$ $ESR \leq 2 \times$ initial ESR value $I_L \leq$ initial specified limit
+105°C, U_R	Can Diameter 30, 35, 40, 45, 50 11000 hrs	
Shelf Life	2000 hrs at 0V +85°C, or 30000 hrs at 0V +40°C	
Temperature range	–40 to +105°C (Operating) –55°C to +105°C (Storage)	

SPECIFICATION

**Mounting**

These capacitors are designed to be mounted by their terminations alone, and may be used in any position. Dummy pins must be isolated on 4 and 5 pin styles.

Terminal Style

OPERATIONAL DATA	RELIABILITY						
<p>Operational Lifetime Please see separate BHC application notes TD003 for calculating operational life expectancy under customer specific conditions.</p>	<p>The failure rate is derived from our periodic test results. The failure rate (λ_R) is therefore only given at test temperature for life tests. An estimation is also given at 40°C. The expected failure rate for this capacitor range is based on our periodic test results for capacitors with structural similarity. Failure rate is frequently quoted in FIT (Failures In Time) where 1 FIT = 1×10^{-9} failures per hour.</p> <table> <tr> <td>T_a</td> <td>Failure rate per hour</td> </tr> <tr> <td>85°C</td> <td>230 FIT</td> </tr> <tr> <td>40°C</td> <td>11 FIT</td> </tr> </table> <p>Failure rate per hour for catastrophic plus parametric failures.</p>	T_a	Failure rate per hour	85°C	230 FIT	40°C	11 FIT
T_a	Failure rate per hour						
85°C	230 FIT						
40°C	11 FIT						

MECHANICAL DATA		
Mounting position The capacitor can be mounted upright or inclined to a horizontal position.	Insulating resistance ≥ 100 Mohms at 100V d.c., across insulating sleeve.	Safety vent A safety vent for over pressure is featured on either the base (opposing end to the terminals) or on the side of the can. This is in the form of a grooved section on the surface of the can which is a weakened area and is designed to relieve build up of internal pressure due to over stress or catastrophic failure.
Vibration 10Hz to 500Hz at 0.75mm or 10g for 3x2hrs duration. 10Hz to 55Hz at 0.35mm or 5g for 3x0.5hrs duration (45/50mm diameter cans).	Voltage Proof ≥ 2500V d.c., across insulating sleeve.	

PEH 526 / 626

**RoHS
Compliant**

- Designed for automotive applications
- Temperature rating 125 °C
- Resistance to vibrations
- Low ESR, High ripple current capability

APPLICATION

A high performance electrolytic capacitor designed for automotive applications with high vibrations and high ambient temperatures.

BASIC DESIGN

An electrolytic capacitor with outstanding electrical performance. It is polarized with the negative pole connected to the case. The outer case has a plastic cover. The low ESR is a result of a low resistive

electrolyte/paper system. Together with the TDC thermal concept, this range has very high ripple current capability. The capacitor is suitable for both mobile and aircraft applications, with operation up to 125°C.

SPECIFICATION

Standards

IEC 60384-4 Long Life Grade 40/125/56
In accordance with CECC 30 301-809

Capacitance range

820-6800 μ F

Capacitance tolerance

-20 to +20%

Rated voltage

25-80 VDC

Temperature range

-40 to +125°C

Leakage current, I_{RL} (μ A)

0.01 (μ A) $\times C_R(\mu$ F) $\times U_R(V)$

Operational life time

4000h at 125°C, 20 000h at 105°C

Shelf life

0V +105°C 5000 h,

+40°C 10 years

Diameter range

22 - 30 mm

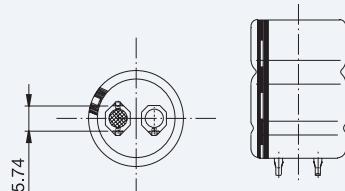

Resistance to vibrations

10 - 2000 Hz, 1.5 mm displacement amplitude or max. 20 g 3x2 hours.
The capacitor shall be clamped by their body.

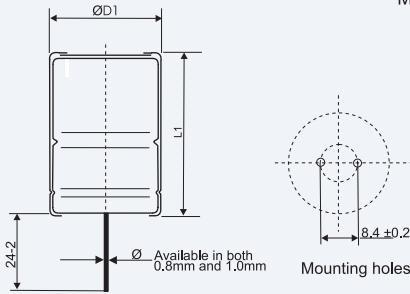

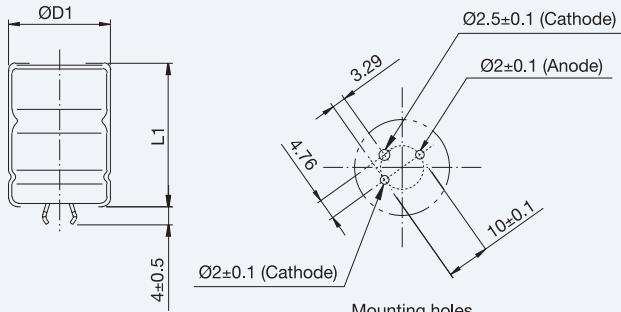

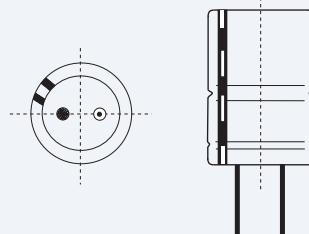

Life test

4000h, 125°C

PEH526

PEH626

OPERATIONAL LIFE AND RIPPLE CURRENT

Operational life (L_{op}), at ambient temperature T_a and ripple current I_{AC} .**Example:**

Article: PEH526KBB4220M3

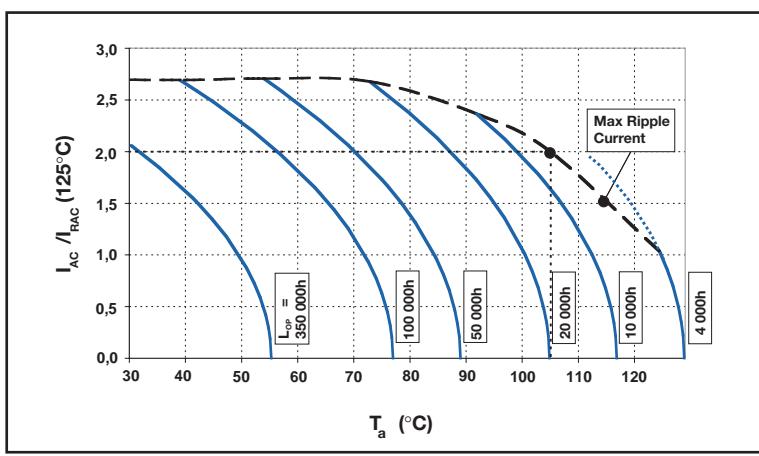

Ambient temperature (T_a): 105°CRipple current, at 10kHz (I_{AC}): 7.6 A

$$I_{RAC}(125^\circ\text{C}, \geq 5\text{kHz}) = 3.8 \text{ A} \text{ (from data table)} \\ \rightarrow I_{AC}/I_{RAC}(125^\circ\text{C}) = 2.0$$

Operational life: Interpolation between the L_{op} -curves $\rightarrow L_{op} \sim 8 \text{ kh}$ (blue curves)

When the capacitor load is at 100Hz,
use $I_{AC}/I_{RAC}(125^\circ\text{C}, 100\text{Hz})$ as input value to
the diagram (see data table). At other frequencies
use $I_{AC}/I_{RAC}(125^\circ\text{C}, \geq 5\text{kHz}) \times 1/\text{Corr} =$

Frequency correction factor, for ripple current (Corr):

	FREQUENCY			
	300 Hz	1 kHz	5 kHz	100 kHz
Correction factor (Corr) (Typical value)	0.70	0.89	1.00	1.03

LEAKAGE CURRENT

Rated leakage current, I_{RL} (μA)

Rated voltage, U_R (V)

Rated capacitance, C_R (μF)

$$I_{RL} = 0.01 \times C_R (\mu F) \times U_R (V)$$

CUSTOMER DESIGN

On request PEH526 can be designed in other capacitance values.

ORDERING INFORMATION

Rated voltage Ur	40 - 450 VDC	
Surge voltage Us	1.15 x Ur (for Ur ≤ 250 VDC) 1.10 x Ur (for Ur ≥ 350 VDC)	Test Condition: ≤ 30s surge, 1000 cycles @ 85°C
Leakage current Il	= 0.006 x Cr x Ur (µA) or 6mA whichever is the smaller. Note, Cr is in µF.	Test Condition: Ur, 5mins., 20°C
Operational life time +85°C, Ur, Il	Can Diameter 25 12000 hrs 30 15000 hrs 35 18000 hrs 40 26000 hrs	End of Life requirement: ΔC/C ≤ ±10% ESR ≤ 2 x initial ESR value Il ≤ initial specified limit
Shelf Life	2000 hrs at 0V +85°C, or 30000 hrs at 0V +40°C	
Temperature range	-40 to +85°C (Operating) -55°C to +105°C (Storage)	

SPECIFICATION

ALT Tag style

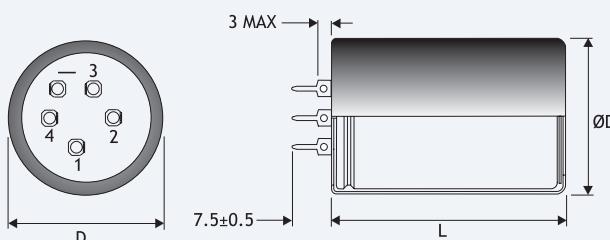

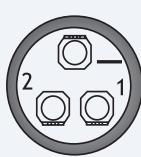

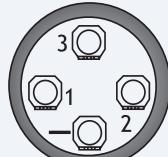

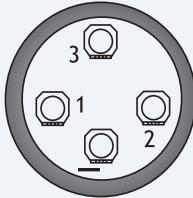

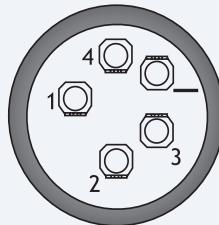

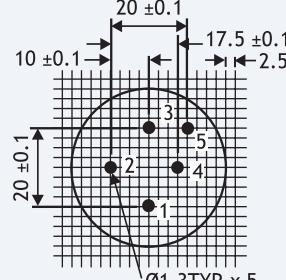

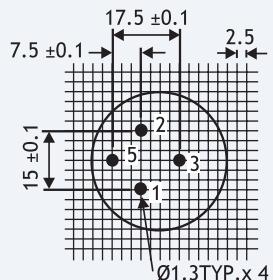

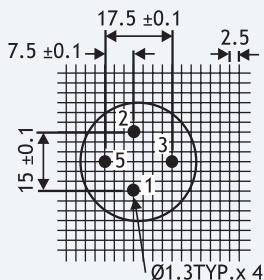

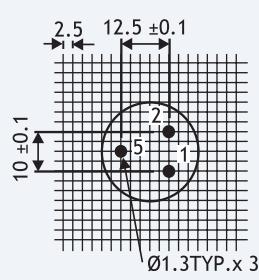

Designed for flying lead connection.

ALP/T/21/23

ALP Pin style

Designed for PCB mounting to DIN 41238.

**ALP Pin and mounting configurations** $\varnothing 25\text{ mm}$  $\varnothing 30\text{ mm}$  $\varnothing 35\text{ mm}$  $\varnothing 40\text{ mm}$ 

Printed circuit board hole positions, viewed from component side.

Connections: Hole 1 represents +ve, Hole 5 represents -ve. Terminals 2,3 and 4 may be at negative terminal potential due to the presence of electrolyte. They are intended for mechanical connections only. It is recommended that they are soldered to the printed circuit board. Additional dummy pins are provided for stability. Note that the case and dummy pins may be at negative terminal potential.

ALN20S Series 85°C

RoHS
Compliant

- 4 Pin Solder tag
- Long Life 18000 hours at 85 °C
(Ur, Ir applied)
- Slit Foil technology

APPLICATION

A new generation of audio capacitors is now available from BHC – T-Network Capacitor (TNC). The TNC has been designed specifically for audio applications by DNM design and is being manufactured in the UK by BHC.

BASIC DESIGN

In a normal capacitor unwanted resistance and inductance force the input and output together electrically, making its unwanted characteristics very critical for performance - figure 1.

The new T-Network capacitor (TNC) behaves differently because the input must flow along the capacitor plate to reach the output. The signal is forced into pure capacitance with most of the unwanted resistance and inductance appearing on each side of the bulk capacitance. The residual defects, therefore, tend to assist capacitance filtering in the T-Network design - figure 2.

The TNC is designed for the most demanding filtering situations and it will redefine performance standards in many non-audio applications. For use in audio amplifiers, the TNC incorporates current slit foil technology to produce the ultimate audio capacitor. These capacitors give excellent results against standard components on a direct replacement. However, TNC high frequency performance is so enhanced that the H.F. compensation of test amplifiers may need resetting for best results.

ALC10S Series 85°C

RoHS
Compliant

- 2 Pin Snap-in
- Long Life 18000 hours at 85 °C (Ur, Ir applied)
- Slit Foil technology

APPLICATION

Modern electrolytic capacitors are designed for use in power supplies so most aspects of their design have been optimised for this application. Some of the advances in design may not be beneficial in audio applications where the requirements of the capacitors are very different.

BHC, in collaboration with an audio research company, DNM Design, have produced the Slit Foil Capacitor specifically for audio applications. This is a patented design which eliminates circulating currents in the aluminium foils. This spurious current flow on the capacitor plates is known to occur, but is not apparent in most applications.

BASIC DESIGN

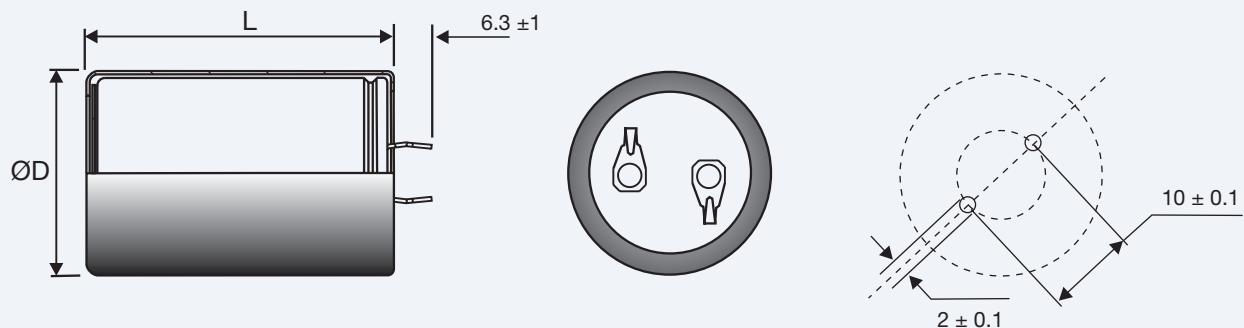

Slit foil capacitor research has also indicated that improvements in the general construction of the capacitors give better results in audio where the fidelity of the waveshape is very important. Great attention has been paid to the construction details which can affect the performance, i.e. foil type, its connections

and the mechanical construction. BHC manufacture a range of capacitors for this type of application in screw terminal, solder tag or board mounting configurations. Details of capacitance and case sizes available in the Slit Foil Capacitors range are available from our sales office.

MS/MD Series 60/70°C

**RoHS
Compliant**

- Intermittent AC Motor Starting
- 6.3 mm Double amp tags (quick connect types)
- VDE approved to EN 60252-2

APPLICATION

A range of aluminium electrolytic capacitors specifically designed for a.c. operation which help to start the motor by providing a leading current to the auxiliary winding. The capacitor is not permanently connected to the winding of the motor and is switched off after starting, usually automatically.

BASIC DESIGN

Capacitors for this application are designed for intermittent duty only, and capable of withstanding the a.c. voltage applied to the motor during starting. The capacitor construction comprise either double anode

or O-style (double anode and floating cathode) windings and are housed in a moulded plastic case. The MD series is VDE approved to EN 60252-2 for the defined ratings.

SPECIFICATION

Standards

DIN EN 60252-2:- AC Motor Capacitors - Part 2 : Motor Start Capacitors

Capacitance range

25 μ F to 750 μ F

Capacitance tolerance

*  Capacitance code

e.g. 030=30 μF , 120=120 μF

TECHNICAL DATA**Dual Voltage Rating**

The MD range of capacitors is designed with a dual voltage rating. The lower voltage rating relates to a duty cycle of 1.67% and the upper voltage rating relates to a duty cycle of 0.55%.

Power Factor

The tangent of the loss angle for motor start capacitors shall not exceed 0.1 and shall be calculated as follows:

$$\tan \delta = \frac{W}{V \times I} = \frac{\text{true watts}}{\text{apparent watts}}$$

Duty Cycle

The standard rating is 1.67% or 1/60th full time and corresponds to a maximum duty of 20 starts, each of three seconds duration per hour. It is expressed as 3/1.67 (a 3 minute cycle with 1.67% duration during which the capacitor may be energised). If the same capacitor is to be used for a duty cycle of 60 starts per hour the cycle duration will be 1 minute. The operation time per cycle will then have to be reduced to 1.67% of 1 minute (i.e. 1 second). Alternative duty cycles are available on request.

Presence of Run Capacitor

When the motor is fitted with both starting and run capacitors, consideration should be given to fitting of the appropriate discharge resistor to the starting capacitor. This is to protect the run capacitor from damage through discharge of the starting capacitor.

Container Form

Cylindrical mouldings, meeting creepage and clearance distances, according to IEC 60335-1 and flammability ratings according to UL94-V1.

TECHNICAL DATA

Discharge Resistors

A discharge resistor may be fitted to a motor start capacitor to prevent electrical overstress of the capacitor and or for safety reasons. In accordance with BS5267 and IEC 60252, the resistor value should be such that it reduces the voltage on the capacitor, from the line voltage to less than 50V within 60 secs.

The resistor value may be approximated as follows:

$$R \text{ (k}\Omega\text{) max.} = \frac{T}{\text{Rated capacitance } \mu\text{F}}$$

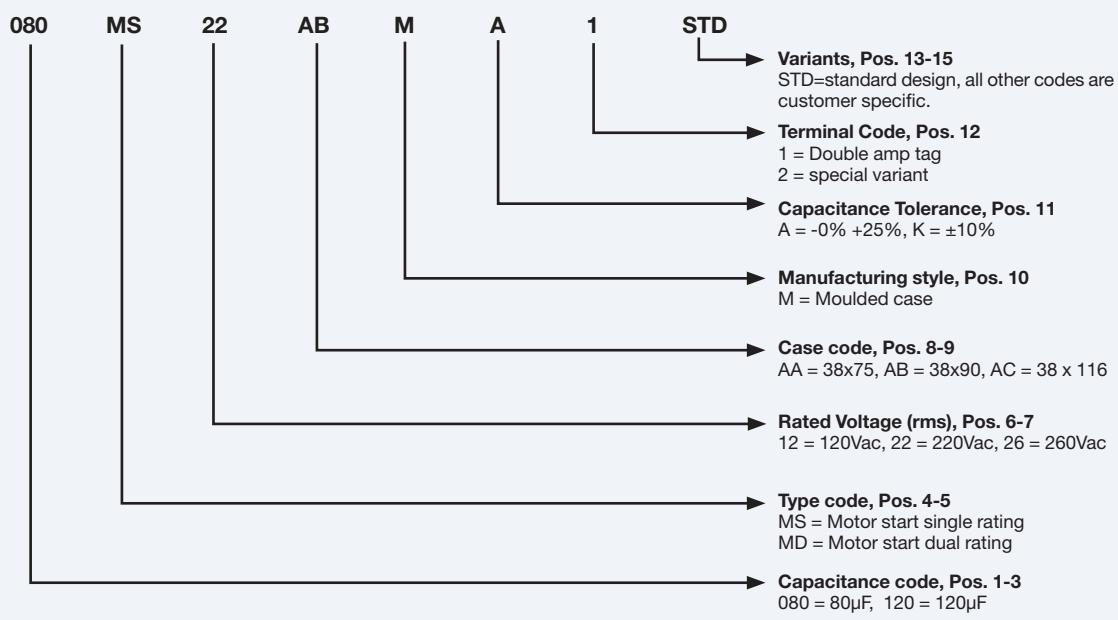

Rated Voltage (d.c.)	T
120	50000
220	32000

CALCULATION EXAMPLE, PEH 200

Article No: PEH200OO427AMB2

Input: Ambient temperature = 70°C
 Ripple current = 30A (10kHz)
 ESR (85°C, 10 kHz) = 5.8 mΩ
 Thermal resistance R_{th} = 2.6°C/W

Calculation: $P_{LOSS} = I_{RMS}^2 \times ESR = 30^2 \times 5.8 \times 10^{-3} = 5.3 \text{ W}$
 Hot spot temp. $T_h = T_a + R_{th} \times P_{LOSS} = 70 + 2.6 \times 5.3 = 84^\circ\text{C}$
 The assumption of hot-spot temp 85°C when we get ESR was OK!

85-84

Output: Expected Life time $L_{OP} = \frac{30000}{2^{12}} = 31k$ hours

Remark! ESR (T_c, f) values, of a given article number, is available upon request. Please contact customer support.

Equivalent series resistance factor k as a function of frequency and winding hot-spot temperature.

$$k_{\text{ESR}} = \frac{T_{hs,f}}{\text{ESR}(20^\circ\text{C}, 100\text{Hz})} \quad \text{ESR}(20^\circ\text{C}, 100\text{Hz}) = 26 \text{ m}\Omega \text{ (Maximum value)} \\ 18 \text{ m}\Omega \text{ (Typical value)}$$

CALCULATION EXAMPLE: PEG 22X (PEG 220, PEG 225, PEG 226)

Article No: PEG 226KL 4270Q

Thermal parameters . PEG220, PEG225 and PEG226:

Input data: Capacitor case temperature $T_c = 125^\circ\text{C}$
 Ripple current = 27.9 A ($\geq 5 \text{ kHz}$)
 ESR (125°C , 5 kHz) = 6.7 m Ω
 (see catalogue sheet)
 Thermal resistance $R_{\text{thhc}} = 2.4^\circ\text{C}/\text{W}$
 (Hot-spot to case, see table)

Calculation: $P_{LOSS} = I_{RMS}^2 \times ESR = 27.9^2 \times 6.7 \times 10^{-3} = 5.2 \text{ W}$
 Hot spot temp. $T_h = T_a + R_{th\text{hc}} \times P_{LOSS} =$
 $125 + 2.4 \times 5.2 = 137.5^\circ\text{C}$

Output: Expected Life time, $L_{OP} = 85 \text{ kh} \times 2^{\frac{85-137.5}{12}} = 4.1 \text{ k hours}$

148 (parameter A)

Max allowed hot-spot temperature, continuous operation:

$$T_{h \max} = 0.5 \times T_C + 75[\text{°C}] \text{ (heat-sunked)}$$

$$T_h - T_C = \max 15 \text{ °C}$$

$$T_{h \max} = 0.5 \times T_a + 75[\text{°C}] \text{ (not heat-sunked)}$$

$$T_h - T_a = \max 40 \text{ °C}$$

PYR 5008 and 7511 resistors

- For voltage balancing and/or discharge of electrolytic capacitors
- Fits capacitor diameters 50–90 mm
- Easy to mount

APPLICATION

Voltage balancing of series connected electrolytic can type capacitors and/or discharge purposes.

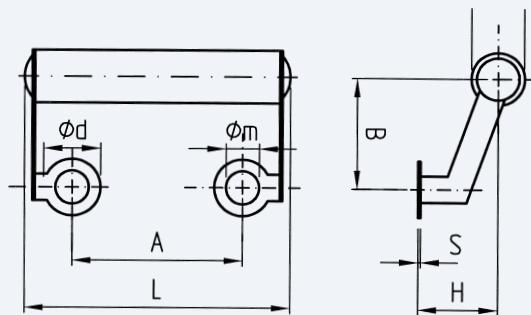

BASIC DESIGN

The PYR resistors are wire wound on a ceramic core and coated with high temperature silicone. The mounting brackets

are made of stainless steel and connected by two point spot welding.

SPECIFICATION

Standards	CECC 40201, MIL -R26E
Resistance range	10–47 kΩ
Resistance tolerance	+/- 5%
Rated voltage	700 VDC acc. to CECC 40201-003
Temperature range	-55 to +105°C

Dimensions table PYR (mm)

Notes

When using mounting clamps care should be taken not to obscure any safety vent in the can. Delivered without bolts and nuts for mounting.
PYC clips are for PEH169 & PEH200 capacitors.

LIMITED WARRANTY ELECTROLYTIC CAPACITORS

Evox Rifa AB warrants that the goods manufactured by Evox Rifa AB are free from defects in design, materials and workmanship.

Evox Rifa AB liability under this warranty shall be limited to replacement or repair free of charge, at Evox Rifa AB factory, provided that notification of such failure or defect is given to Evox Rifa AB immediately upon the same becoming apparent and that on Evox Rifa AB's request the goods are promptly returned to Evox Rifa AB carriage paid. In case goods thus returned as defective, prove to be without fault or defect, Evox Rifa AB is entitled to charge buyer 10% of the value of returned goods.

If the goods supplied or part thereof are not manufactured by or branded RIFA, Evox Rifa AB will only extend to buyer the benefit of the warranty granted by the manufacturer of the goods. Evox Rifa AB liability is further limited to a period of 12 months from the date of shipment to the buyer.

Evox Rifa AB shall not be liable for any defect which is due to accident, fair wear and tear, negligent use, tampering, improper handling, improper use, improper operation or improper storage or any other default on the part of any other person other than Evox Rifa AB.

Evox Rifa AB shall have no other liabilities in case of defective goods than those stated

above and shall under no circumstances be liable for any consequential loss or damage arising from the use of goods sold by Evox Rifa AB. Liability under paragraph 823 BGB is expressly excluded.

The above limitations of Evox Rifa AB liability for defective goods shall apply also with regards to product liability, and Evox Rifa AB shall have no responsibility for injury to persons or for damage to goods or property of any kind.

In case of product liability claims from third parties against Evox Rifa AB, not falling within Evox Rifa AB liability in accordance to the above, buyer shall hold Evox Rifa AB harmless.
