

System Reset (with battery back-up) Monolithic IC MM1134

Outline

These ICs protect S-RAM data in back-up mode (CS signal makes R-SAM CE pin low and \overline{CE} pin high) when power supply voltage goes below a certain set voltage (detection voltage 3.5V, 4.2V typ.). Further, it switches from main power supply to battery back-up when power supply voltage drops. Conversely, when power supply rises, it first switches the S-RAM from battery back-up to main power supply (switching voltage 3.3V typ.), then from back-up mode to normal mode (CS signal makes S-RAM CE pin high and \overline{CE} pin low). These signal processes provide reliable protection against data damage.

Features

- 1 Power supply switching circuit (switching between main power supply and battery)
- 2 CS control for S-RAM (normal mode : S-RAM can be accessed, back-up mode: S-RAM can not be accessed low current consumption mode)
- 3 With CS signal gate circuit

Characteristics

1. Battery back-up		
1. Low IC current consumption (loss current)		0.3 μ A typ.
2. Drop voltage inside IC (input/output voltage difference)	$I_o=100\mu A$	0.3V typ.
3. Reverse current (reverse leak current)		0.1 μ A max.
2. Normal operation		
1. Drop voltage inside IC (input/output voltage difference)	$I_o=50\mu A$	0.2V typ.
2. Output voltage $V_{cc}=5V$	$I_o=50mA$	4.8V typ.
3. Battery- V_{cc} switching voltage		3.3V typ.
4. Detection voltage (CS, \overline{CS} , reset output)	A : 3.5V typ. B : 4.2V typ.	

Package

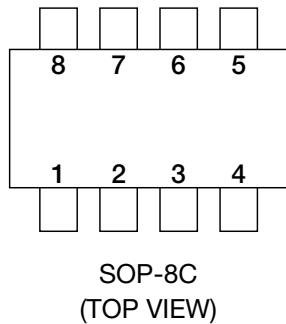

SOP-8C (MM1134 □F)

*□contains detection voltage rank.

Applications

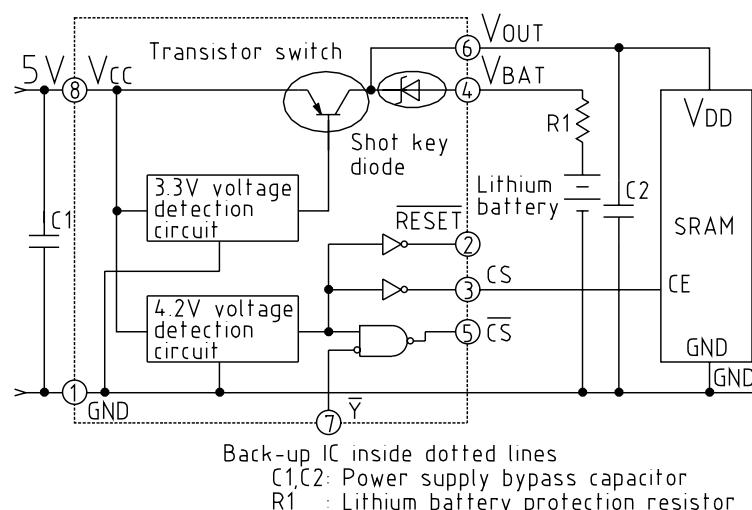

1. Memory cards (S-RAM cards)
2. PCs, word processors
3. Fax machines, photocopiers, other office equipment
4. Sequence controllers, other FA equipment
5. Video games and other equipment with S-RAMs
